## Executive Summary

## Background

The Memorial University Area Traffic Study was commissioned in 2014, by the City of St. John's, Memorial University of Newfoundland and the Provincial Department of Community Services with a purpose to examine the longer term transportation infrastructure needs in and around the University area. Over the past 5 years, the University and the Health Sciences Centre Complex have seen significant growth in infrastructure including a $150,000 \mathrm{ft}^{2}$ expansion to the Faculty of Medicine, a new 820 space parking garage, and two new residences on campus that accommodate the housing needs for some 500 students. Growth in infrastructure is an on-going concern in the study area. The new Core Sciences Facility is an example of a large project that is presently under construction and that will contribute to traffic pressures in the area.

Past traffic impact studies conducted in the study area have indicated that that many of the intersections along the Prince Philip Drive Corridor operate at very poor levels of service with little or no residual capacity remaining, an indication that clearly illustrates the need to take a broader longer term look at the transportation infrastructure needs of the area.

Hatch Mott Macdonald (now Hatch) was originally retained by the City of St. John's in 2014 to complete this traffic impact study; Harbourside Transportation Consultants (HTC) was subsequently retained by Hatch as sub-contractor to complete the project. Other sub-consultants involved in the various aspects of this project included Brook Mcllroy and Brian Taylor who handled the Transit ad TDM components of this project.

## Study Area

The study area for this project includes the segment of Allandale Road extending from the Outer Ring Road to Elizabeth Avenue, the segment of Prince Philip Drive extending from the east entrance to the Confederation Building west to Thorburn Road. The study area also includes the section of Elizabeth Avenue extending from Allandale Road west to Freshwater Road. The study area is identified in Figure 1.

## Study Methodology

The methodology for the MUN Area Traffic Study followed fairly standard procedures for this type of study. The main workflow tasks included:

- Project Initiation and Information Gathering
- Stakeholder and Public Engagement
- Traffic Operations Analysis
- Assessment of Network Improvements
- Public Transit
- Transportation Demand Management and Parking
- Pedestrian Safety
- Review of Campus Specific Issues
- Draft Report Documentation and Public Engagement
- Final Report Documentation

The main goal is to develop a future vision of the transportation network within the study area that will accommodate projected growth to the year 2025.

## Public Consultation

Key stakeholder and public engagement consultations were recognized as vital components to the study in understanding existing conditions on the MUN area. A total of 9 stakeholder groups and organizations were identified and solicited for feedback on various aspects of this project.

A website was activated for this project with an interactive mapping feature which allowed participants to pinpoint areas of concern throughout the study area. There were nearly 200 comments received within the first three weeks of the website launch. The input gathered from the web map was used to better understand the existing conditions from the perspective of the daily users, to identify alternative solutions, as well as to assist in the preliminary evaluation of alternative solutions.

A project on-line survey was also used to obtained specific information on key topics for this project. In total, 414 responses were received to the 11-question project survey which remained online on the project website for a period of four weeks.

There were also two public information sessions held on campus in June of 2014 to explain the purpose of the project and to obtain feedback from those in attendance.

Summaries of the consultation components of this project are noted in the Introduction section of the report.

## Traffic Analysis

The traffic analysis for this study was completed by the study team using a number of different software packages. The Synchro/SimTraffic (Version 9) software package was used as the main evaluation tool for the signalized and unsignalized level of service analysis completed for this report. The study team also used the ARCADY/Junctions 8 software to analyze the level of service for the suggested roundabout locations. VISUM, which is a macroscopic transportation planning modelling software package, was also used in the high level traffic analysis.

HTC completed two levels of traffic analysis for this study. The first will be referred to as the detailed traffic analysis. This analysis involved a sub-area of 6 study intersections and used existing traffic volumes that were both factored and adjusted by an agreed amount to reflect the anticipated growth in the study area. The redistribution of traffic patterns expected to occur with the completion of the Team Gushue Highway was considered, however, the effects in the model were small and to remain conservative - no adjustments were made to the model. The traffic volumes were prepared by Hatch Mott MacDonald, approved by the

City of St. John's and provided to HTC to complete the detailed traffic analysis. The detailed analysis results would be used to plan capital improvements that are required at the key intersections within the study area within the next 5 years.

The second analysis, which is referenced as the high level traffic analysis, relied on the traffic volumes obtained from the City's 2025 VISUM models. The results from this analysis are used to highlight, conceptually, the improvements that may be required at some point in the future within the Study Area to accommodate the future growth and projected traffic volumes. These improvements would be used for planning purposes but would be reaffirmed in a more comprehensive Transportation Planning exercise that is planned by the City of St. John's as they update their Transportation Plan in the near future.

## Detailed Traffic Analysis

The detailed traffic analysis involved a sub-area analysis of 6 study intersections using existing traffic volumes that were both factored and adjusted by an agreed amount to reflect anticipated growth in the study area to the year 2025.

The scope of work for the detailed traffic analysis included:
Task 1 - A level of service analysis for the following conditions at each of the 6 intersections included within the sub-analysis work.

- Scenario 0 - Existing conditions.
- Scenario 1 - Conditions expected to be present in 2025 based on volumes that have been factored and adjusted to reflect the normal background traffic growth, the redistribution of traffic patterns associated with the Team Gushue Highway and the new Core Sciences Facility development.
- Scenario 2 - Same traffic volumes as Scenario 2 with improvements made to the study network.

Task 2 - Production of conceptual drawings and cost estimates for the improvements that are identified in the analysis as being required.

The study area for this detailed analysis includes six intersections - three on Prince Philip Drive and three on Elizabeth Avenue, near Memorial University. The six intersections that were analyzed, complete with the month and year counted, include:

- Prince Philip Drive/Columbus Drive \& Thorburn Road - March 2013
- Prince Philip Drive \& Clinch Crescent/Westerland Road - October 2013
- Prince Philip Drive \& Allandale Road - April 2013
- Elizabeth Avenue \& Allandale Road/Bonaventure Avenue - March 2012
- Elizabeth Avenue \& Westerland Road - May 2013
- Elizabeth Avenue \& Freshwater Road - April 2013

Findings/Recommendations - Detailed Traffic Analysis
Prince Philip Drive/Columbus Drive \& Thorburn Road
The intersection of Prince Philip Drive and Thorburn Road is one of the largest, most complex intersections that the City of St. John's controls. This intersection already has three through lanes in both the north and southbound directions and a dual left turning lane on Thorburn Road. The results of our analysis indicates that little or nothing can be done with the present method of traffic control at this intersection in terms of signal timing, phasing, cycle length changes or with auxiliary lane additions that will provide an acceptable level of service at this intersection for 2025. Our analysis, using a multi-lane roundabout as the method of traffic control, yielded acceptable results in terms of the LOS during both analysis periods.

Accordingly our recommendation, is to reconfigure the intersection to a multi-lane roundabout as shown in Figure 7.

## Prince Philip Drive \& Clinch Crescent/Westerland Road

The intersection of Prince Philip Drive and Clinch Crescent/Westerland Road is also a major intersection for the City of St. John's. It provides a secondary access to the Health Sciences complex from Prince Philip Drive and provides both vehicular and pedestrian connections to both sides of campus. The results of our analysis, indicate that little or nothing can be done with the present method of traffic control at this intersection in terms of signal timing, phasing, cycle length changes or with auxiliary lane additions that will provide an acceptable level of service at this intersection for 2025. Our analysis, using a multilane roundabout as the method of traffic control, yielded acceptable results in terms of the LOS during both analysis periods. Our recommendation is to reconfigure this intersection to a multi-lane roundabout.

This design does not match with the long term concept plan developed for this area of the study. In the long term concept plan, this intersection was configured as a 3-way roundabout with Westerland Road being closed to through traffic. This is being done to address the public input HTC had received and concerns in relation to pedestrian safety.

## Prince Philip Drive \& Allandale Road

The intersection of Prince Philip Drive and Allandale is a large, relatively complicated signalized intersection with heavy traffic flows on most approaches to the intersection. This intersection has experienced a high number of collisions - 98 collisions over a 3 year period (2009-2011). The results of the analysis indicate that little or nothing can be done with the present method of traffic control at this intersection in terms of signal timing, phasing, and cycle length changes or with auxiliary lane additions that will provide an acceptable level of service at this intersection for 2025. Our analysis, using a multi-lane roundabout as the method of traffic control, yielded acceptable results in terms of the LOS during both analysis periods. HTC included a right turn by-pass lane on the northwest side of the roundabout to accommodate the heavy right turn volumes at this location. This by-pass lane may not
be required based on the long term concept plan that includes the Clinch Crescent to Mt. Scio Road connection.

## Elizabeth Avenue \& Allandale Road/Bonaventure Avenue

The intersection of Elizabeth Avenue and Allandale is a busy signalized intersection located at the eastern boundary of the study area. The results of our analysis indicate that the traffic volumes projected or forecasted to be present at this intersection can function under a signalized intersection control configuration. Some timing changes and some geometric lane improvements will be necessary, as detailed in Section 2.2.9.

## Elizabeth Avenue \& Westerland Road

The Elizabeth Avenue intersection with Westerland Road is one of the smaller intersections included within this sub-area analysis. The analysis of the 2025 peak hour volumes indicates that an acceptable LOS can be achieved with a minor geometric improvements (the addition of an auxiliary right turn lane in the westbound direction) and some timing changes to the controller.

This design does not match the long term concept plan that was developed for the Elizabeth Avenue area of the study. Under that concept plan this intersection was removed totally from the network in this area.

## Elizabeth Avenue \& Freshwater Road

The analysis work completed by HTC at the intersection of Elizabeth Avenue Road and Freshwater Road shows that this intersection functions well during the 2025 analysis period.

It should be noted that traffic currently spills back during both peak periods from the Oxen Pond intersection with Freshwater and affects the operation at Freshwater Road and Elizabeth Avenue. So, while the sub-area analysis shows a good level of service, things are likely to be much worse in 2025 because of the operational problems at the Freshwater Road intersection with Oxen Pond Road. Further review of the Oxen Pond Road/Freshwater Road intersection will be required to resolve this problem.

The results of the detailed traffic analysis clearly indicate that the three intersections along Prince Philip Drive will be over capacity by the year 2025 in both analysis periods. The recommendations for these intersections are largely the same as those identified as being required in the high level analysis.

It should be noted that while only minor improvements are suggested along Elizabeth Avenue in the detailed analysis, single lane volumes of 650-850 vehicles per hour do not leave much spare capacity for unanticipated or expected growth in volumes. Much of the public feedback on this project indicates that pedestrian safety is a major concern along Westerland Road and hence the comments and concepts that are developed in Section 4.2 of report apply. In the long term, the segment of Westerland Road from Prince Philip Drive to Elizabeth Avenue should be removed from service altogether.

HTC heard during the public consultation process that that many people, including the administration of the campus, did not want to see any additional widening of Elizabeth Avenue. This was a significant influencing factor in the rationale to provide a roundabout corridor along Elizabeth Avenue in the long term. This configuration will handle the traffic flows without any widening. A raised median in the centre of Elizabeth Avenue and an active transportation (AT) trail along the north side of the road is recommended as well. Maintaining a conventional corridor of traffic signals will not facilitate that vision.

## Estimated Costs - Detailed Traffic Analysis

The estimates of the improvements associated with the detailed analysis are noted below Table A. HTC has also provided a priority plan for these different projects. It is recommended that the City of St. John's proceed to the preliminary design stage to obtain more accurate costing for budgetary purposes. The total cost of the improvements associated with the detailed analysis is $\$ 4.95$ million dollars.

Table A: Detailed Traffic Analysis - Estimated Improvement Costs

| Detailed Analysis |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | :---: | :---: | :---: | :---: |
| Priority | $\$$ |  |  |  |  |  |  |
| 1 | Prince Philip Drive \& Allandale Road | $1,600,000$ |  |  |  |  |  |
| 2 | Prince Philip Drive \& Clinch Crescent/Westerland Road | $\$$ | $1,200,000$ |  |  |  |  |
| 3 | Prince Philip Drive/Columbus Drive \& Thorburn Road | $\$$ | $1,800,000$ |  |  |  |  |
| 4 | Elizabeth Avenue \& Allandale Road/Bonaventure Avenue | $\$$ | 200,000 |  |  |  |  |
| 4 | Elizabeth Avenue \& Westerland Road | $\$$ | 150,000 |  |  |  |  |
| Total Cost of Detailed Analysis | $\$ 4,950,000$ |  |  |  |  |  |  |

## High Level Traffic Analysis

The high level traffic analysis completed by HTC for this project involved a number of different VISUM modelling scenarios for both the AM and PM peak hour analysis periods. They include:

- Scenario 1-2025 projection of normal growth within the study area.
- Scenario 2-2025 projection of normal growth with road network improvements.
- Scenario 3-2025 projection of normal growth with road network improvements and new development.
- Scenario 4-2025 projection of normal growth with road network improvements and new development. This scenario includes the widening of Elizabeth Avenue and the proposed link from Allandale Road to Clinch Crescent.
HTC also added a scenario, 4B, which was evaluated to consider roundabouts as an alternative to signal controls at poorly performing signalized intersections throughout the study area road network.

Findings / Recommendations - High Level Traffic Analysis
Modelling Scenario 1 is a year 2025 projection of the traffic volumes expected to be present on the study area road network under existing intersection timing/phasing and lane configurations in both the AM and PM peak periods of day. During the PM peak hour, under the volumes for the Scenario 1, most of the intersections in the study area suffer from poor levels of service and congestion (refer to section 2.2.4). Even with minor improvements to signal timings/phasing and lane configurations where appropriate, as modelled under Scenario 2, there is little improvement in levels of service and congestion throughout the study area road network. LOS conditions under Scenario 3, the campus study area growth scenario, are slightly better because of improvements put in place at the Elizabeth Avenue intersection with Freshwater Road, but overall, many intersections throughout the study area still suffer from poor levels of service and congestion and more predominately so during the PM peak hour. Under Scenario 4, Option A, traffic volumes are again projected to the year 2025, growth is considered, and several significant changes are made to the MUN area road network, including the addition of a new link from the intersection of Mt. Scio Road/Allandale Road to Clinch Crescent and the widening of Elizabeth Avenue to two through lanes in each direction from Allandale Road to Freshwater Road and Stamp's Lane. The results of the LOS analysis for Scenario 4, Option A in the PM peak hour indicate some improvements in the LOS for some study area intersections when compared to the LOS results for Scenario 3. Six of the study area's 20 intersections show an improvement.

The new roadway connecting the intersection of Mt. Scio Road and Allandale Road to Clinch Crescent is expected to draw an average daily traffic volume of $18,500 \mathrm{vpd}$. This new roadway, in combination with the additional lanes on Elizabeth Avenue, reduce the overall traffic volumes on segments of Prince Philip Drive and Allandale Road, by approximately 650 vehicles, but the relief, while significant and needed, is not sufficient itself to re-establish acceptable levels of service at the vast majority of intersections throughout the study area.

With signal systems optimized, the options available to gain additional capacity at many of the study areas signalized intersections and improve the level of service results to within acceptable norms are limited. Traffic volumes either have to be reduced (i.e. more emphasis placed on transit/active transportation and other TDM measures), streets have to be widened to provide additional lanes, or there has to be a departure from the traditional method of traffic control (i.e. traffic signals) that are presently used at many of the study area intersections.

Scenario 4, Option B is the roundabouts scenario for the study area. The study team replaced the traffic signals at 14 intersections throughout the study area with roundabout control and in doing so were able to re-establish acceptable levels of service at the vast majority of the study area intersections without the need to widen any existing streets in the study including Elizabeth Avenue.

Summaries of the overall intersection LOS results from both Synchro/SimTraffic and ARCADY for both the AM and PM peak hour analysis periods for Scenarios 1, 2, 3, 4, Option A and Scenario 4, Option B are shown in Table 12 and Table 13.

## Estimated Costs - High Level Traffic Analysis

Harbourside Transportation Consultants has provided Class 5 cost estimates for the projects that had been envisioned under the primary analysis for this study. These estimates do not reflect costs of any land acquisition that may be required to facilitate the same.

Figure A: Roundabout \& Roadway Modifications

A priority plan for the primary analysis improvements was not established by HTC. It was assumed this would be provided when the work associated City's Transportation Plan update gets underway in near future.

The total estimated cost of the improvements that have been suggested by HTC under the detailed traffic analysis work completed for this project is $\$ 21.7$ million dollars. Again, this cost does not reflect land acquisition nor does it reflect the cost of the storm sewer upgrading that will be required along the Elizabeth Avenue corridor.

Table B: High Level Analysis Cost

| Road Network Modifications |  |  |  |
| :---: | :---: | :---: | :---: |
| New Roadways |  |  |  |
|  | New Clinch Crescent Connector | \$ | 3,000,000 |
|  | Prince Philip Drive \& Elizabeth Avenue Corridor (New Road - Roundabout B to Roundabout E) | \$ | 1,000,000 |
|  | Total New Roadway Cost | \$ | 4,000,000 |
| Road Network Improvements |  |  |  |
| 1 | Freshwater Road/Elizabeth Avenue to Elizabeth Avenue/New Road | \$ | 600,000 |
| 2 | Elizabeth Avenue/New Road to Elizabeth Avenue/Allandale Road/Bonaventure Avenue | \$ | 1,000,000 |
| 3 | Prince Philip Drive/Clinch Crescent (West) to Prince Philip Drive/New Road | \$ | 500,000 |
| 4 | Prince Philip Drive/New Road to Prince Philip Drive \& Clinch Crescent (East) | \$ | 300,000 |
| 5 | Prince Philip Drive \& Clinch Crescent (East) to Prince Philip Drive \& New Campus Road | \$ | 500,000 |
| 6 | Prince Philip Drive \& New Campus Road to Prince Philip Drive \& Allandale Road | \$ | 600,000 |
| 7 | Clinch Crescent \& Arctic Avenue to Clinch Crescent \& New Clinch Crescent Connector | \$ | 300,000 |
|  | Campus Road | \$ | 250,000 |
|  | Total Road Network Improvements Cost | \$ | 4,050,000 |
| Roundabouts |  |  |  |
| A | Freshwater Road \& Elizabeth Avenue | \$ | 750,000 |
| B | Elizabeth Avenue \& New Road | \$ | 600,000 |
| C | Elizabeth Avenue \& Allandale Road/Bonaventure Avenue | \$ | 1,000,000 |
| D | Prince Philip Drive \& Clinch Crescent (West) | \$ | 900,000 |
| E | Prince Philip Drive \& New Road | \$ | 900,000 |
| F | Prince Philip Drive \& Clinch Crescent (East) ${ }^{1}$ | \$ | 900,000 |
| G | Prince Philip Drive \& New Campus Road | \$ | 1,100,000 |
| H | Prince Philip Drive \& Allandale Road ${ }^{1}$ | \$ | 1,500,000 |
| 1 | Clinch Crescent \& Arctic Avenue | \$ | 750,000 |
| J | Clinch Crescent \& New Clinch Crescent Connector | \$ | 750,000 |
| K | Allandale Road \& Mt. Scio Road | \$ | 1,200,000 |
| L | Allandale Road \& Confederation Building Entrance | \$ | 750,000 |
| M | Allandale Road \& Higgins Line | \$ | 750,000 |
| N | Prince Philip Drive/Columbus Drive \& Thorburn Road ${ }^{1}$ | \$ | 1,800,000 |
|  | Total Roundabout Cost | \$ | 13,650,000 |
|  | :al Cost for High Level Analysis |  | 700,000 |

${ }^{1}$ Please note that the configurations for Roundabouts F, H \& N are different between the detailed analysis and high-level analysis. As a result, the costs between Table A and Table B for these roundabouts are different.

## Long Term Network Improvements

## Widening of Elizabeth Avenue

The widening of Elizabeth Avenue from Bonaventure Avenue to Freshwater Road has been an on and off again topic of discussion many years with the City of St. John's. In 1998, this project was discussed in the City's Transportation Plan and contemplated as an improvement that could reduce the traffic pressures on Prince Philip Drive by providing additional capacity on a parallel route. The thought at that time was to widen Elizabeth Avenue to five lanes to provide that capacity.

Elizabeth Avenue is a critical connection and access route for students, faculty and the staff at MUN. It serves as an access area for vehicles, pedestrians and cyclists. There is a need to continue and improve upon this access to the south side of campus, but solutions must to be sensitive to local residents and side street accesses as well as pedestrian safety. The ultimate solution should provide additional vehicle capacity at the intersections while providing an environment which promotes lower speeds, pedestrian safety and side street/driveway access.

The public feedback HTC has received on this issue, has indicated that there was no desire to create another high speed, high capacity facility like Prince Philip Drive. There is, however, a need to create additional vehicle capacity to share the traffic load with Prince Philip Drive. Without it, Prince Philip Drive traffic will continue to grow to levels that will exceed the capacity of the intersections.

An alternative concept plan for Elizabeth Avenue was developed by HTC that will increase the capacity of the street and its intersections, while also minimizing capital improvement costs and disturbance to the local neighbourhood. This concept involves the introduction of a roundabout corridor, complete with a non-traversable median and AT trail provisions.

The introduction of roundabouts at key intersection locations, medians and a narrower corridor will enable the City to create a greener, more aesthetically-pleasing streetscape which can easily accommodate all users: vehicles, pedestrians, cyclists and others.

Sketches SSK-12 to SSK-14 illustrate the proposed long term changes HTC is recommending along Elizabeth, between Freshwater and Bonaventure Avenue including a typical road cross-section concept for Elizabeth Avenue. The overall plan can been seen on drawing SSK -1. All drawings can be found in Appendix C.

## Proposed Roadway connection - Allandale Road to Clinch Crescent

The proposed road network connection from the Mt. Scio Road intersection with Allandale Road to Clinch Crescent has also been an on and off again topic of discussion for as far back as when the original planning was completed for the Outer Ring Road, and while this link may have generated some discussion at various times, it has never formed part of the original planning package for the construction of the Outer Ring Road.

The comparison of the VISUM model analysis completed by HTC for Scenarios 3 and 4A indicate that the proposed roadway from the intersection of Mt. Scio Road and Allandale Road to Clinch Crescent will handle fairly significant volumes during both the AM ( $1,370 \mathrm{vph}$ ) and PM ( $2,370 \mathrm{vph}$ ) peak hour periods. The proposed route is attractive for motorists in the study area and will help reduce the traffic volumes on Prince Philip Drive and Allandale Road to more manageable levels. The roadway does provide a much more direct route from the Outer Ring Road to the University and the Health Sciences Complex, both of which are major traffic generators. It also provides an alternative means of access to the Health Sciences complex that is not reliant on Prince Philip Drive.

The proposed roadway from the intersection of Mt. Scio Road and Allandale Road to Clinch Crescent may be needed in the long term. The roadway should be built to a two lane standard with roundabouts used as the method of traffic control at intersections. Flaring to two lanes may be required on the entrance to the roundabouts. The City of St. John's should consider establishing a 35 m right of way width to allow for future expansion of the roadway should that become required.

## Operational Network Improvements

## Prince Philip Drive/Morrissey Road/Irwin's Road and Livyer's Loop

The Prince Philip Drive intersection with Morrissey Road has been a source of complaints for both pedestrians and motorists for many years. The geometric alignment and configuration of this intersection is not conventional in terms of what motorists expect from a four way signalized intersection. The east intersection of Irwin's Road and Livyer's Loop has also been problematic for quite some time. The poor alignment and merge onto Prince Philip Drive do not meet any TAC geometric design guideline standards. To deal with these problems, HTC is recommending that a reconfiguration of the road network in this area. The reconfiguration involves closing the Morrissey Road intersection with Prince Philip Drive. The segment of Morrissey Road between Artic Avenue and Prince Philip Drive would be removed and the medians on Prince Philip Drive closed and fenced accordingly to prevent pedestrian movements across Prince Philip Drive at this location. Traffic on Arctic Avenue would be rerouted left onto Morrissey Road and eventually to a new roadway extending from Morrissey Road to the east intersection of Livyer's Loop with Prince Philip Drive. A roundabout would be installed at this intersection. The Livyer's Loop approach to the roundabout would be restricted to a right turn by-bass lane. This, of course, would be optional and is being suggested for the sole purpose of controlling the amount of short cutting traffic moving from Elizabeth Avenue to Arctic Avenue and points west on campus. The segment of Irwin's Road along the frontage of the Main Dining Hall would be turned into a limited access cul-de-sac, used mainly for deliveries, etc.

The existing pedestrian tunnel near St. John's College has recently been upgraded to provide a usable grade separated link in this area of campus. A new multi-use underpass on the Morrissey to Livyer's alignment should be investigated as part of this closure of this intersection. This underpass may also be able to serve smaller maintenance vehicles. The one way restriction on the segment of Livyer's Loop from Irwin's Road to the access to the parking lot for the Science Building should remain in place as a permanent feature.

## Westerland Road/Pedestrian Concerns

One of the more prominent and recurring themes that came up during the public consultation process (the interactive website) and through the stakeholder consultation process, was the pedestrian safety issue on Westerland Road. Westerland Road is the only direct connection between Elizabeth Avenue and Prince Phillip Drive that exists west of Allandale Road, and the only such connection which runs through the MUN campus. Due to the nature of its connectivity, Westerland Road is subject to relatively heavy traffic volumes as an alternate path to and from the MUN campus and the Health Sciences Center. Besides the vehicular traffic on Westerland Road, it is also the site of a large volume of pedestrian traffic, including the two of the busiest pedestrian crossings within the study area.

There has been a long-standing concern with the conflicts introduced between the heavy vehicle traffic and the heavy pedestrian traffic on Westerland Road. This has created a number of accidents and nearmisses through the years. The University has undertaken a pedestrian crossing study in the recent past and one of the recommendations included a set of improvements intended to improve pedestrian safety on Westerland Road. These recommendations included high visibility flashing beacons to increase crosswalk visibility and roadside bulb-outs intended to reduce vehicle speeds and to minimize crossing distances. These improvement measures have recently been installed and the University, by all accounts, is pleased with the resulting road section. The improvements are getting favourable feedback and reaction from the students, faculty and other users.

While these improvements are appearing to have a positive impact, there is concern that the positive impacts may be a function of drivers reacting to a change in conditions and that the driver behaviour may migrate towards its previous conditions (high volumes, high speeds) after drivers become familiar with the new conditions. It is recommended that the crossings be monitored over time to ensure the new beacon system remains effective.

In the long term, and in keeping with the goals of the Campus Master Plan (Brook Mcllroy), it is HTC's recommendation that the vehicle/pedestrian conflicts be completely eliminated. This could be achieved by relocating Westerland Road to the west, effectively removing the road from the interior of campus and building it on the periphery of the campus, to the west of any on-campus parking. The proposed layout is illustrated in Figure 38 and on drawing sketch SSK-14 in Appendix C.

## Public Transit

As part of the Public Transit review for this project a number of key areas were examined in some detail by the sub-consultant dealing with Transit and TDM issues on this project, Brian Taylor. From a transit perspective, these areas included a public transit operational review, a fare strategy review, a review of transit planning and a service review. The recommendations stemming from each area review are noted below.

Public Transit Operational Review

- Metrobus to develop a comprehensive printed route map and schedule booklet showing all bus routes and scheduling information such as major transfer points, terminals and major destinations as well as bicycle routes and walking paths connecting to transit service.
- Metrobus to install printed route map and schedule displays at major transit destinations, transit terminals and bus shelters and in the Health Sciences Center, Memorial University and the Confederation Building.
- Metrobus to investigate the installation of interactive electronic screen displays in major transit points, malls and transit terminals displaying transit route and real-time transit information and transit trip planning capability.
- Metrobus to develop a transit information booklet for inclusion the university student orientation package.

## Fare Strategies

- M-Card has become the method of choice for most Metrobus customers. Effort should be made to reduce the time lag in loading and uploading of rides and passes on M-Cards and expand sales outlets.
- Metrobus to complete the study of a U-Pass program for Memorial University students and consider expansion of the program to other educational institutions (refer to Appendix E).
- Metrobus to investigate the implementation of an employer-provided bus pass program with major employers, including the faculty and staff at Memorial University, the Health Sciences Center and the Provincial Departments located in the Confederation Building and the City of St. John's. The combination of a U-Pass program for Memorial University students and an EcoPass program for employees at the university, Health Services Center and Confederation Building would significantly increase ridership and fund service improvements on transit routes serving these institutions.
- Metrobus to revisit the timed transfer policy. Many transit systems have adopted a timed transfer policy. Research should be carried out on other transit systems regarding policies to reduce abuse of the policy. It is recommended to reduce the time allowed for a valid transfer from 120 minutes to 90 minutes after the last time point on a route.

## Transit Planning

- The St. John's Transit Commission continue to engage the Province and neighbouring municipalities in discussions to develop a regional transit system.
- Metrobus staff work with City planning staff to promote transit-oriented design in future development plans.
- Metrobus staff work with the City of St. John's to install transit priority signals and queue-jump lanes at key intersections.
- Metrobus work with Memorial University to improve the Arctic Avenue terminal.
- Metrobus work with City staff to install transit priority signals along Prince Phillip Drive.
- Metrobus identify a suitable location for a new transit terminal to serve the Health Sciences Center and Memorial University. The corner lot at Clinch Crescent and Prince Phillip Drive should be considered as a possible location.
- Metrobus work with the Avalon Mall to improve transit facilities.
- Metrobus develop a bus shelter program to increase the number of bus shelters including criteria for locating shelters and guidelines to determine the amenities that should be included at each location.
- Metrobus develop a park-and-ride program to identify possible locations for park-and-ride sites and transit service to the study area.

## Service Review

- Routes 24 and 26 to provide express service with one (1) morning trip only. Due to fleet availability constraints, no evening return express trip is available. Staff should look at realigning other service to allow a return express trip on Routes 24 and 26.
- Metrobus to conduct regular passenger counts and surveys to ensure transit routes are meeting ridership goals and performance.
- There is a high level of service along Prince Phillip Drive to the Health Sciences Center and Memorial University. Investigate if some service could be re-routed along Elizabeth Avenue and up Westerland Road to these institutions.
- Metrobus to investigate the implementation of an express bus network connecting major transit terminals and park and ride locations to major destinations.
- Metrobus to begin planning of accessible transit service on conventional transit routes considering transit routes that serve the Health Sciences Center and Memorial University as a priority.
- Metrobus to evaluate the response to the service with possible expansion of neighbourhood bussing to serve communities popular for off-campus student housing such as the Kenmount Terrace and Crosby Road areas.
- Metrobus to consider extending Friday and Saturday evening service by providing a late night shuttle between the terminal at City Hall/Mile One and the University. This service could be delivered using the smaller Community Transit vehicle.
- Metrobus to develop policies and procedures for providing bicycle travel on transit.
- Plan the installation of bicycle racks at transit terminals and major transit destinations.
- Work closely with the local cycling community to promote transit and cycling as a travel options.
- Metrobus investigate the introduction of a "Guaranteed Ride Home" program for Metrobus customers.
- Metrobus consider the introduction of stop announcements at major transit stops and destinations.

## Transportation Demand Management (TDM)

Transportation Demand Management (TDM) involves the use of various policies, programs, services and products to influence the manner in which people travel. The idea of TDM is to motivate people to travel using different modes of transportation including walking, cycling, transit and ridesharing. For individuals that take advantage of TDM programs and services, they have greater choices and convenience, they save both time and money, and they reap the benefits of a healthier more sustainable lifestyle.

By properly managing the demand for travel, municipalities can, and have in some instances, reduce the need for new or widened roads, reduce the environmental and social costs of car use, and have increased their return on the investments they have made in walking, cycling, transit and ridesharing throughout the communities they manage.

The project team has examined and made recommendations on a number of different strategies that could be employed to more effectively promote and enhance Transportation Demand Management in relation to public transit, parking, cycling, walking and active transportation. These strategies include:

- Strategy 1: Partnerships to promote sustainable transportation and awareness of the benefits of public transportation.
- Strategy 2: Improve transit facilities to improve bus access and customer amenities using transitfriendly design guidelines.
- Strategy 3: Partnerships to promote active transportation initiatives.
- Strategy 4: Develop parking policies that encourage greater transit use.
- Strategy 5: Investigate the use of transit priority measures to reduce transit travel times and improve schedule adherence and on-time performance.
- Strategy 6: Use Intelligent Transportation Systems to improve transit service.
- Strategy 7: Establish a U-Pass program for full-time Memorial University students and an EcoPass program for Memorial University faculty and employees and employees at the Health Sciences Center and Confederation Building.
- Strategy 8: Develop a "suite" of service delivery options for public transit.
- Strategy 9: Adding value to the transit experience
- Strategy 10: Develop park-and-ride sites strategically located at the periphery of the urban core with express bus service into the study area.

## Crosswalks and Pedestrian Safety

As part of the Crosswalk and Pedestrian Safety component of the project, the study team reviewed a total of 22 pedestrian crossing locations with the MUN campus study area. Eight of these crossings are located on streets with significant traffic volumes and speeds. These were assessed using the TAC Pedestrian Crossing Control Guide to determine whether or not appropriate control measures are in presently in place. Several locations required some upgrading to meet the TAC standards. The remaining 14 pedestrian crossings were located within the internal campus road network and were evaluated for the presence of signage, pavement markings, lighting, sight distance obstructions etc. Summaries of the assessments results are contained in Section 7 of the report.

HTC recommends the following improvements be made at all crosswalks throughout the MUN campus, not just the 22 that were assessed:

- Re-painting the zebra crosswalk markings (inlaid thermoplastic crosswalks)
- WC-2 signs should be placed on each approach to pedestrian crossings
- Removal of red and/or amber flashing beacons
- All signage should be inspected for retro reflectivity

In addition to the crosswalk assessments, HTC is also recommending a new pedestrian tunnel be installed across Prince Philip Drive at the Morrissey Drive intersection and that new overhead pedestrian walkways be installed connecting the Education Building to the New Core Sciences Facility to the parking garage and finally to the Health Sciences Centre. Concept plans of the proposed connections and of the tunnel location are noted in Figure 39 and Figure 40.

## Campus Specific Issues

As part of the Campus Specific Issues section of the MUN Area Traffic Study, Brook Mcllroy, the authors of the original Campus Master Plan (CMP), reviewed the transportation recommendations from the CMP, discussing the recommendations that have been implemented, as well as those that remain to be addressed.

As part of this section of the report, Brook Mcllroy has examined key improvements that are being proposed as part of the MUN Area Traffic Study and provided commentary related to the compatibility of these improvements to the overall CMP. The key improvements included the Elizabeth Avenue upgrading, the improvements suggested in the area of Prince Philip Drive/Morrissey Road and on Irwin's Road and Livyer's Loop, the Westerland Road relocation plan and the cost of parking on Campus.

The findings indicated that overall there is a strong compatibility between the Campus Master Plan and the MUN Area Traffic Study and that the adoption of the Traffic Study recommendations will advance the goals and objectives of the CMP.

## 1 Introduction

### 1.1 Background

The City of St. John's, Memorial University and Health and Community Services have partnered together to undertake the Memorial University Area Traffic Study to examine the longer term transportation infrastructure needs in and around the University area. Over the past five years, Memorial University and the Health Sciences Complex have seen significant growth in infrastructure including a 152,000 $\mathrm{ft}^{2}$ expansion to the Faculty of Medicine, the construction of an 820 space parking garage, and the construction of two new residences that will accommodate 500 students. The capital cost of construction is in the area of $\$ 128$ million. In the next five years, plans are in the works for the construction of a new Core Science Facility having an estimate global project value of $\$ 325$ million.

The current and planned expansions to Memorial University and the Health Sciences Complex have, and will continue to, generate additional traffic to this area of the City of St. John's. This area is also a major employment node, employing 14,500 people on both a full and part time basis between the University, Health Sciences Complex, and the Confederation Building. There are approximately 18,000 full and part time graduate and undergraduate students registered on the St. John's Campus. The transportation implications associated with this growth, the employment characteristics of this area, and the number of students registered to attend classes on the St. John's campus are significant. The pressures exerted on the area's roadways including Prince Philip Drive, Allandale Road and Elizabeth Avenue are evident during both peak and non-peak traffic periods of the day. Congestion along Prince Philip Drive, Allandale Road and Elizabeth Avenue are daily occurrences that not only cost motorists things associated with travel delays such as increased fuel consumption and vehicle operating expenses, but that also contribute to losses in productivity and higher greenhouse gas emissions. There is also a serious concern about the ability of maintaining good access for emergency vehicles to the Health Sciences Complex at all times of the day.

The City's 1998 Transportation Plan, which was completed by SGE, recommended a number of significant transportation related infrastructure improvements to accommodate the projected growth throughout the City of St. John's over the study's horizon year time frame. These projects included:

- Construction of the Outer Ring Road.
- Completion of the Team Gushue Highway.
- Completion of the East End Arterial.
- Movement of trucks between the East End of the City and the Downtown.
- Widening of Elizabeth Avenue from Allandale Road to Freshwater Road.

The Outer Ring Road is constructed and fully operational, with some segments handling in excess of 30,000 vehicles per day. The Team Gushue Highway (south of Kenmount Road) is presently under construction and is scheduled to open in the fall of 2017. The only project that has not already been fully considered by the City of St. John's is the widening of Elizabeth Avenue from Allandale Road to Freshwater Road. The purpose of this project, as it was contemplated in the 1998 Transportation Plan, was to provide additional capacity in an east/west direction that would relieve some of the pressures on the Columbus Drive/Prince Philip Drive corridor.

The traffic study completed by Hatch Mott MacDonald in 2010 for the proposed parking garage and parking lot expansion at Memorial University did take into consideration some of the anticipated growth in the study area. However, the mandate of this work was to determine the traffic impacts associated with the new garage and parking lot expansion and to suggest ways, in the short term, to mitigate the associated impacts. These improvements, which have not yet been completed, included a number of short term solutions at many of the intersections along Prince Philip Drive. The solutions included the addition of and lengthening of a number of auxiliary left and right turning lanes. While this study did not look at any of the longer term transportation needs of this area, it did highlight the fact that many of the intersections along the Prince Philip Drive Corridor were operating at very poor levels of service with little or no residual capacity remaining. That study clearly illustrated the need to take a broader longer term look at the transportation infrastructure needs of the area which is the overall purpose and mandate of the Memorial University Area Traffic Study.

### 1.2 Study Area

The study area for this project is shown in Figure 1. It includes the segment of Allandale Road extending from the Outer Ring Road to Elizabeth Avenue, the segment of Prince Philip Drive extending from the east entrance to the Confederation Building west to Thorburn Road. The study area also includes the section of Elizabeth Avenue extending from Allandale Road west to Freshwater Road.

Two different traffic analyses were completed for this project which included a detailed and a high level traffic analysis. The first 6 intersections, listed below, were included in the detailed traffic analysis and all 20 intersections were included in the high level traffic analysis. A complete listing of the intersections and roadways included within the study area for this project are noted below.

## Intersections

1. Allandale Road @ Prince Philip Drive
2. Prince Philip Drive @ Westerland Road
3. Prince Philip Drive @ Thorburn Road
4. Elizabeth Avenue @ Allandale
5. Elizabeth Avenue @ Westerland Road
6. Freshwater Road @ Elizabeth Avenue
7. Outer Ring Road @ Allandale Road (2 intersections)
8. Allandale Road @ Mt. Scio Road
9. Allandale Road @ Higgins Line
10. Allandale Road @ West Entrance to Confederation Building
11. Clinch Crescent @ Arctic Avenue
12. Prince Philip Drive @ East Entrance to Confederation Building
13. Prince Philip Drive @ Morrissey Road
14. Prince Philip Drive @ Clinch Crescent
15. Prince Philip Drive @ Wicklow Street
16. Freshwater Road @ Thorburn Road
17. Freshwater Road @ Stamp's Lane
18. Elizabeth Avenue @ Paton Street
19. Elizabeth Avenue @ Anderson Avenue

Figure 1: Key Intersections and Roadways

### 1.3 Data Collection

Existing traffic volumes for the 2014 base year were based on data provided by the City of St. John's and traffic counts conducted by Harbourside Transportation Consultants (HTC). The City of St. John's provided the following four-hour intersection counts:

- Allandale Road @ Mt. Scio Road - December 2012
- Allandale Road @ Higgins Line - December 2012
- Allandale Road @ West Entrance to Confederation Building - March 2013
- Allandale Road @ Prince Philip Drive - April 2013
- Prince Philip Drive @ East Entrance to Confederation Building - September 2013
- Prince Philip Drive @ Morrissey Road - March 2013
- Prince Philip Drive @ Westerland Road - October 2013
- Prince Philip Drive @ Clinch Crescent - November 2012
- Prince Philip Drive @ Wicklow Street - November 2012
- Prince Philip Drive @ Thorburn Road - March 2013
- Freshwater Road @ Thorburn Road - October 2012
- Freshwater Road @ Elizabeth Avenue - April 2013
- Elizabeth Avenue @ Paton Street - March 2013
- Elizabeth Avenue @ Anderson Avenue - March 2013
- Elizabeth Avenue @ Westerland Road - May 2013
- Elizabeth Avenue @ Allandale - March 2012

HTC conducted four-hour intersection counts (7:00-9:00AM, 4:00-6:00PM) at the following intersections:

- Clinch Crescent @ Arctic Avenue - February 2014
- Outer Ring Road @ Allandale Road - February 2014
- Freshwater Road @ Stamp’s Lane - February 2014

The 2013 and 2014 traffic count data is included in Appendix A.

In addition to the traffic counts conducted for the traffic analysis, HTC also gathered traffic and pedestrian data at 8 different locations within the study that are prominent pedestrian crossings. These counts were conducted in March of 2014. Copies of the counts are included in Appendix A.

### 1.4 Study Methodology

The methodology for the MUN Area Traffic Study was developed based on the requirements detailed in Section 4.0 of the terms of reference for the study. The main goal is to develop a future vision of the transportation network within the study area that will accommodate the projected growth in the year 2025. The main workflow streams included:

1. Project Initiation and Information Gathering
2. Stakeholder and Public Engagement
3. Traffic Operations Analysis
4. Transportation Demand Management/Assessment of Non-Auto Modes
5. Review of Campus Specific Issues
6. Draft Report Documentation and Public Engagement
7. Final Report Documentation

Our technical traffic operational analysis conducted as part of this traffic impact study followed the procedures identified by the Institute of Transportation Engineers (ITE) for the preparation of traffic impact studies. Figure 2 provides a conceptual summary of this approach.

## Study Approach

Figure 2: Traffic Analysis - Study Approach
$\xrightarrow{n}$

### 1.5 Intersection Performance Measures

Intersection measures of performance were reviewed and compared for different network and traffic volume scenarios during the analysis that was completed for this study. The analysis used industry standard techniques.

The main evaluation tool used in the analysis for this report was the Synchro/SimTraffic software which analyzes typical measures of performance based on the methodology of the Highway Capacity Manual (Transportation Research Board, 2000). The SimTraffic micro-simulation traffic software was also used in the course of the analysis to illustrate and identify interactions between individual driver types and the effects of adjacent or closely spaced intersections. The ARCADY/Junctions 8 software was used to analyze roundabout options. ARCADY uses the TRL/Kimber empirical method to assess roundabouts.

Three primary measures of performance are typically used to evaluate the performance of an intersection. These are outlined below:

Volume to Capacity Ratio (v/c) - Volume to capacity ratios relate the estimated traffic volumes (demand volume) to the theoretical maximum volume that could be accommodated (capacity volume/adjusted saturation flow rate). As the v/c ratio approaches 1.0, the movement has reduced ability to accommodate any additional volume of traffic. Generally, intersection control or road infrastructure movements can alleviate any reduced residual capacity

Level of Service (LOS) - LOS is a qualitative measure which describes operational conditions. It is based on service measures such as freedom to manoeuvre, travel time, speed, and traffic interruptions. LOS is expressed as a scale from ' $A$ ' to ' $F$,' where LOS A represents free flow conditions or very low delay (less than 10 seconds per vehicle at an intersection), and LOS F represents delay times that are unacceptable to motorists using the facility (greater than 50 seconds at a STOP sign control or greater than 80 seconds at traffic signals). Generally speaking, a minimum LOS D is considered acceptable; however, the desirable design level of service is generally accepted as being LOS D or better.

Tables in the remainder of this report use the following colour code to identify the six levels of service:

| Level of Service Rating | Percentile Delay (seconds / vehicle) |  |
| :---: | :---: | :---: |
|  | Signalized Intersection | Stop-controlled Intersection |
| A | $\leq 10.0$ | $\leq 10.0$ |
| B | $>10.0$ and $\leq 20.0$ | $>10.0$ and $\leq 15.0$ |
| C | $>20.0$ and $\leq 35.0$ | $>15.0$ and $\leq 25.0$ |
| D | $>35.0$ and $\leq 55.0$ | $>25.0$ and $\leq 35.0$ |
| E | $>55.0$ and $\leq 80.0$ | $>35.0$ and $\leq 50.0$ |
| F | $>80.0$ | $>50.0$ |

Queue Capacity - Queue capacity at intersections is critical to the performance of the network. As part of the analysis process, queue lengths were examined and recommendations were made to ensure that sufficient vehicle storage is available to maintain efficient traffic flow.

The analysis results tables display the LOS, volume to capacity ratio, delay per vehicle, and queue length results for turning movements of each approach to the intersection as calculated by Synchro. The average delay per vehicle simulated in SimTraffic, the equivalent LOS based on these delays, and the $95^{\text {th }}$ percentile queue lengths are also summarized. The traffic volume figures also show the intersection LOS.

The analysis results tables of this report display overall intersection delay and LOS as calculated by Synchro and the overall intersection average delay per vehicle simulated in SimTraffic with the equivalent LOS based on these delays.

### 1.6 Initial Public Consultation \& Findings

### 1.6.1 Stakeholder and Public Engagement

Stakeholder and public engagement was recognized as a vital component of this study in understanding the existing conditions of the MUN Area traffic network. The use of various tools to solicit feedback and input from the public provided valuable insight in identifying issues and concerns of the daily transportation users of the University and surrounding area.

As part of the initial consultation process, HTC identified key stakeholders and agencies in order to gain their knowledge and input of current problems, possible future developments and potential improvements. Information was gathered through stakeholder interviews and email correspondence. Key stakeholders identified by the project steering committee included the following:

- Newfoundland Department of Transportation and Works
- Eastern Health
- MUN - Facilities Management Division
- Metro Bus
- MUN Students Union (Graduate and Undergraduate)
- C.A. Pippy Park Commissions
- Bicycle Newfoundland
- Provincial Department for Advanced Education and Skills
- Health and Community Services

### 1.6.1.1 Stakeholder Response Summary

Below summarizes the responses received by email or through a personal interview:

- Newfoundland Department of Transportation and Works

The Newfoundland Department of Transportation and Works is represented on the project steering committee by Mr. John Morrissey, P.Eng. - Manager of Highway Design and Traffic Engineering. Mr. Morrissey indicated that he would be providing comments on the study on an ongoing basis as part of the project steering committee. He did want to note for the project team that contrary to Section 4.07 of the terms of reference "Long Term Network Improvements" that he could not find any record of the suggested new roadway link extending from the Mount Scio Road intersection with Allandale Road to Clinch Crescent in the original plan for the Outer Ring Road or documentation indicating that it had been intentionally removed from the planning process at that time.

- Eastern Health and Health and Community Services

Eastern Health and Health and Community Services (HCS) provided one combined response from Mr. Joe Dunford, M.Eng, P.Eng., Regional Director - Infrastructure Support for input into the overall study. Eastern Health and HCS have concerns with respect to the following:

General Traffic concerns and Pedestrian Safety

- Congestion at the main entrance to the Health Sciences Complex (HSC) especially in the area of the main ticket booth/ parking lot entrance.
- The ability to maintain emergency access to the HSC during the 100 year storm event.
- Congestion during the PM peak hour at the Prince Philip Drive intersection with Clinch Crescent.
- Code Requirements for Fire Truck Routing and emergency exits.
- Speeding issues on Clinch Crescent. Suggestion for installation of feedback signage.
- Ambulance access on the North Mosdell entrance.
- The pedestrian crossing on the east side of the Janeway going to the walking trail is a concern.
- The pedestrian crossing from the parking garage is an issue due to its location.

## Transit and TDM

- Consideration of a stop being placed close to the Hostel entrance.
- The cost of parking should be considered.
- Cycling should be promoted.
- Electric Cars... provision and promotion of the same.
- MUN - Facilities Management Division

The Facilities Management Division of MUN was represented by Mr. Darrell Miles, P.Eng - Director, Operations and Maintenance. The following general concerns and issues were noted in an interview with Mr. Miles on April 1 ${ }^{\text {st }}, 2014$.

## General Traffic Concerns

- Traffic congestion is a real concern on Westerland Road. It was noted that the roadway blocks occasionally for periods of in excess of 20 minutes during peak traffic periods. Drivers often get frustrated and pass on the inside. Speeds increase at night.
- Russell Road, Phelan Road and Livyer's Loop are often used by motorists as an effective short cut route to the Health Sciences Complex. The University presently has temporary restrictions in place prohibiting NB traffic on a small section of Livyer's Loop. This has effectively reduced the amount of through traffic being experienced in the area.
- There are approximately 2,000 students that leave residences in the morning to attend classes on campus. Limiting the amount of through traffic in this area is an important safety issue in this regard.
- The Livyer's Loop alignment with Morrissey Road and Prince Philip Drive is extremely poor which results in an overlap in vehicle turning paths. The poor geometrics often distracts drivers from paying attention to the pedestrians at this intersection. A grade separated intersection at this location may be an option worth investigating.
- The alignment of Russell Road and Phalen Road is another concern. It was suggested that it may be more appropriate to realign Russell Road and Phelan Road with Rodney Street which would avoid traffic travelling through what are in essence at the present time parking areas.
- Artic Avenue is used as a shortcut route to access the HSC. There are a number of well used pedestrian crossings along this route and speeds are high. The crossing at Kerwin Place and Artic Avenue was specifically noted.
- The pedestrian crossing by the bridge on Clinch Crescent is also a concern.
- The Education building is a major drop off and pick up point on campus. This activity often causes backups and operational problems on Westerland Road.
- Any widening of Elizabeth Avenue has to be designed properly reflecting the pedestrian patterns and activities in the area.

## Parking and Transit

- At the present time, the cost of a student parking pass on campus is very low relative to demand of student vs. faculty/staff.
- The collective agreements of MUNFA and CUPE prevent any substantial increase in the cost of a parking permit. The cost can only be increased yearly by the consumer price index.
- MUN sees the advantage from a TDM perspective to increasing these fees. The University's position is to try and recover costs on all new parking infrastructure put in place.
- The UPass concept is an important TDM measure. It will not gain the acceptance needed to pass a student referendum unless the problems associated with the limited areas presently serviced is resolved.
- Metrobus

Metrobus is represented by Judy Powell, the General Manager. The project team received both written and verbal feedback from Mrs. Powell on the MUN Area traffic study. The main area of concern relates to the University Centre and the difficulty Metrobus has in front of this facility with conflicts due to parked cars and pedestrians which result in delays and safety concerns. The layby area in front of the University Centre barely provides space for 2-3 buses to dwell at a time and is often congested with motorists dropping off or picking up students. Metrobus indicated that the road network in the area of the University Centre is just not conducive to transit operations. Concern was also expressed with traffic operations on Westerland Road which also results in delays in service due to heavy vehicle and pedestrian traffic in the area.

Metrobus expressed concern that facilities for transit are inadequate at the present time. If a UPass program were introduced in the future a well-designed transit terminal would be required in the area of the University Centre. Consideration would also have to be given to the street network and to other operational improvements such as transit priority to ensure the efficient and safe operation of transit on campus.

- MUN Students Union (Undergraduate)

The MUN Undergraduate Students Union was interviewed by the study team to obtain feedback on the MUN Area traffic study. The student's representatives included Candice Simms and Ashley Holloway. The following comments and feedback were obtained during the interview process with the study team.

## General Traffic Concerns

- The main area of concern for the Students Union was the traffic congestion on campus during peak traffic periods.
- They indicated approximately 50\% of students attending Memorial presently live in areas not serviced by transit and as a result they would not support any suggestion of a universal transit pass (UPass). They also indicated that transit frequency and timing on campus is poor. They like the idea of a "park and ride" that would likely benefit a wider audience than just students.
- The intersection of Artic Avenue and Clinch Crescent is a concern. The students indicated that this intersection performs poorly during peak traffic periods. They indicated that at the very least the intersection of Artic Avenue and Clinch Crescent should be considered as a candidate for traffic signal controls.
- The speed of traffic is an issue and pedestrian safety is a concern specifically at the crossing of Kerwins Place and Artic Avenue.
- The students liked the idea of ride sharing and carpooling.
- It was indicated there needs to be more cycling education and that motorists don't know how to react to cyclists when they encounter them. They talked the need for good cycling facilities on campus such as covered bike parks, a bike share program, and bike lockers.
- The students seems to be fine with the suggestions being made in terms of improvements along Elizabeth Avenue; the AT trail in particular.
- The students were not concerned about the new link being suggested by the study team that would connect Clinch Crescent to the intersection of Allandale Road and Mt. Scio Road.
- C.A. Pippy Park Commission

The C. A. Pippy Park Commission is represented by Mr. Rick Mercer and while the project team never received a formal response to our requests for input into the study project team did have a verbal conversation with Mr. Mercer on the overall scope of the project in which it was indicated that the C. A. Pippy Park Commission would be opposed to the construction of a new roadway link extending from Clinch Crescent to the intersection of Allandale Road and Mt. Scio Road.

Despite numerous attempts made by the study team, no feedback on the MUN Area traffic study was received from Bicycle Newfoundland and Labrador (BNL), the Provincial Department for Advanced Education and Skills, or the Graduate Students Union (GSU). Copies of any written responses received from the identified stakeholders are contained in Appendix D.

### 1.6.2 Project Website

A project website was created to serve as the primary source of online information for the project providing relevant background information, project material and public notification. One of the most critical features of the project website was the interactive map, which allows the user to indicate areas of concern and provide comments detailing the issue. Figure 3 below is a screenshot of the interactive map.

Figure 3: Screenshot of Interactive Web Map

There were nearly 200 comments within the first three weeks of the website launch. The input gathered from the web map was used to better understand the existing conditions from the perspective of the daily users, to identify alternative solutions, as well as to assist in the preliminary evaluation of alternative solutions. Figure 4 illustrates some common themes from comments received. A complete list of comments is contained in Appendix D.

Figure 4: Common Themes from the Interactive Web Map

### 1.6.3 Project Survey

A brief online survey was launched on June 3, 2014 using SurveyMonkey to solicit feedback from members of the public. The survey was available on the project website for a four week period and included 11 multiple choice questions. In addition, the City and the University's Twitter and Facebook accounts were used to notify the public of the survey.

There were a total of 414 responses to the project survey. Nearly all (96.4\%) of the survey respondents were identified to reside off campus with the greater majority ( $72.5 \%$ ) using personal vehicle to travel to and from the campus. $64.5 \%$ identified public transit services to and from the University to be inadequate. Frequent services, extended routes and reduced travel times were among the top three incentives to encourage the use of public transit. The following summarizes the results of the survey. Detailed analysis results are contained in Appendix D.

How do you usually travel to/from the University?

\author{

- Public Transit <br> - Carpool <br> - Personal Vehicle <br> - Cycle <br> Walk
}

Do you think public transit services to/from the University are adequate?

### 1.6.4 Public Information Session \#1

The notice of the first Public Information Session was issued by the City on June 5, 2014 through the City of St. John's website. A media release document can be found in Appendix D. In addition, both the City and the University used social media to communicate with the public about the details of the Public Information Session.

Two sessions of the first Public Information Session were held on Thursday June 12, 2014 at the Gushue Hall on MUN campus: an afternoon session from 2:00pm to 4:00pm and an evening session from 7:00pm to $9: 00 \mathrm{pm}$. There were four representatives from the consultant project team, in addition to one representative from both the City and the University. There were four people in attendance at the afternoon session and two people at the evening session. A City Councilor was also present during the evening session. News reporters from the Canadian Broadcasting Corporation (CBC) conducted interviews with the public and the consultant team during the afternoon session. A new article on the study can be found in Appendix D.

The purpose of the sessions was to introduce the study to the public and present the existing condition information gathered to date. The public was encouraged to provide their feedback and ask questions on the information presented. The sessions included display boards of the study area, existing traffic conditions and large maps of the University Campus and surrounding transportation network for the public to mark-up. A brief Power Point presentation on the study was also given to the public. Attendees were encouraged to sign-in, review the information presented, complete a comment sheet and provide input during the workshop. The Power Point presentation was made available for public viewing on the project website following the Public Information Session.

## 2 Traffic Analysis

The traffic analysis for this study was completed by the study team using a number of different software packages. The Synchro/ SimTraffic (Version 9) software package was used as the main evaluation tool for the signalized and unsignalized level of service analysis completed for this report. Synchro was used to analyze network intersections and their LOS measures of performance based on the methodology of the Highway Capacity Manual (Transportation Research Board, 2000). SimTraffic, the micro-simulation component of the software package, was also used in the course of the analysis to check delay, illustrate and identify interactions between upstream, adjacent and/or closely spaced intersections. The study team also used the ARCADY/Junctions 8 software to analyze the level of service for the suggested roundabout locations. The analysis reflects components of the geometric design such as entry width, flare lengths, entry radius and inscribed circle diameter. VISUM which is a macroscopic transportation planning modelling software package was used to inform future intersection and link traffic volumes under different network conditions for the high level traffic analysis.

HTC completed two levels of traffic analysis for this study. The first, which will be referred to as the detailed traffic analysis, involved a sub-area of 6 study area intersections and used existing traffic volumes that were both factored and adjusted by an agreed amount to reflect the anticipated growth in the study area. The redistribution of traffic patterns expected to occur with the completion of the Team Gushue Highway were considered, however were found to be small and to remain conservative, no adjustments were made for this analysis. The traffic volumes were prepared by Hatch Mott MacDonald, approved by the City of St. John's and provided to HTC to complete the detailed traffic analysis. The detailed analysis results would be used to plan capital improvements that are required at the key intersections within the study area within the next 5 years.

The second analysis, which is referenced as the high level traffic analysis, relied on the traffic volumes obtained from the City's 2025 VISUM models. It was agreed that the results from this analysis would be used to highlight, conceptually, the improvements that may be required at some point in the future within the Study Area to accommodate the future growth and projected traffic volumes. These improvements would be used for planning purposes but would be reaffirmed in a more comprehensive Transportation Planning exercise that is planned by the City of St. John's as they update their Transportation Plan in the near future.

### 2.1 Scenario 0 - Existing Traffic Analysis

Scenario 0 is the analysis of the existing conditions at the 6 intersections for the detailed traffic analysis which includes the existing lane configuration, existing traffic volumes and existing signal timing plans. The 6 intersections selected for the detailed traffic analysis were:

- Prince Philip Drive @ Thorburn Road
- Prince Philip Drive @ Westerland Road
- Prince Philip Drive @ Allandale Road
- Elizabeth Avenue @ Allandale
- Elizabeth Avenue @ Westerland Road
- Elizabeth Avenue @ Freshwater Road
$\xrightarrow{\text { Iempartatio- Cinntatn-1 }}$

Traffic volumes that were used in Scenario 0 analysis at the 6 study area intersections are shown below in Figure 5.

| Existing Traffic Volumes \#\# (\#\#) = AM (PM) |  |  |  | $\left[\begin{array}{c} (396) \\ 284 \\ \downarrow \end{array}\right.$ |  | $\begin{aligned} & \underset{\pi}{\widetilde{y}} \\ & 0 \\ & \sim \end{aligned}$ | $\uparrow$545(324) |  | $\leftarrow$ | 525 | (688) |

Figure 5: Scenario 0 - Existing Traffic Volumes AM (PM)

HTC used Synchro/SimTraffic (v9) to analyze the existing conditions at the 6 intersections. Table 1 and Table 2 shown below, reflects the AM and PM peak hour results of that analysis. It provides the level of service (LOS), delay per vehicle, volume to capacity ( $\mathrm{v} / \mathrm{c}$ ) ratio and the queue length of each approach movement to the intersection. The detailed Synchro/SimTraffic results can be found in Appendix F.

Table 1: Scenario 0 - Existing Traffic Volumes - AM Peak Hour - Synchro/SimTraffic Analysis Results

|  |  | Scenario 0 - Existing - AM Peak Hour |  |  |  |  |  |  |

### 2.1.1 Discussion of the Results - Scenario 0

The Scenario 0 Level of Service results noted above, perform fairly well during both the AM and PM peak hour periods. The detailed descriptions of each intersection are below.

## Columbus Drive/Prince Philip Drive \& Thorburn Road

As indicated in the results above, both the AM and PM peak hours have an overall intersection LOS D and are acceptable, however the northbound approach movement and the southbound left-turn approach are operating at LOS E. Also, in the PM peak hour the eastbound left-turn movement operates at LOS E and is nearing capacity.

The SimTraffic analysis indicates the intersection is operating at an overall LOS C in both the AM and PM peak hours with the northbound through movement operating at LOS E.

## Prince Philip Drive \& Clinch Crescent/Westerland Road

As indicated in the results above, both the AM and PM peak hours have an overall intersection LOS E and are nearing capacity. During the AM peak hour the eastbound left-turn movement and the northbound through movement operate at LOS E and the westbound through and right-turn movements operate at LOS F. During the PM peak hour the northbound left-turn movement and the southbound right-turn movement operate at LOS E and the westbound through and right-turn movements operate at LOS F.

The SimTraffic analysis indicates the intersection is operating at an overall LOS E in the AM peak hour with the westbound approach operating at LOS F. The SimTraffic analysis indicates the intersection is operating at an overall LOS D in the PM peak hour with the westbound right-turn, southbound rightturn and northbound through/right-turn approach operating at LOS E and northbound left-turn operating at LOS F.

## Prince Philip Drive \& Allandale Road

As indicated in the results above, both the AM and PM peak hours have an overall intersection LOS D. During the AM peak hour the westbound through and right-turn movement operate at LOS E and the northbound left-turn movement operate at LOS F. During the PM peak hour the eastbound left-turn, westbound left-turn, northbound left-turn and southbound through movements operate at LOS E and the westbound through and right-turn movements operate at LOS F.

The SimTraffic analysis indicates the intersection is operating at an overall LOS C in the AM peak hour with the westbound through and northbound left-turn movement operating at LOS E. The SimTraffic analysis indicates the intersection is operating at an overall LOS F in the PM peak hour with the westbound approach and northbound left-turn movement operating at LOS F and northbound through and southbound left-turn movements operating at LOS E.

## Bonaventure Avenue/Allandale Road \& Elizabeth Avenue

As indicated in the results above, both the AM and PM peak hours have an overall intersection LOS D. During the AM peak hour the northbound through movement operates at LOS E and southbound leftturn movement operates at LOS F with all other approaches operating at LOS D or higher. During the PM peak hour, the northbound through and southbound left-turn movements operate at LOS E with all other movements operating at LOS D or higher.

The SimTraffic analysis indicates the intersection is operating at an overall LOS D in the AM peak hour with the northbound right-turn and the southbound left-turn movements operating at LOS E and northbound left-turn and through movements operating at LOS F. The SimTraffic analysis indicates the intersection is operating at an overall LOS C in the PM peak hour with the northbound left-turn movement operating at LOS E.

## Elizabeth Avenue \& Westerland Road

As indicated in the results above, both the AM and PM peak hours have all movements operating at LOS D or higher, which is considered acceptable.

## Elizabeth Avenue \& Freshwater Road

As indicated in the results above, both the AM and PM peak hours have all movements operating at LOS C or higher, which is considered acceptable. It has been noted however, that during peak times the intersection of Oxen Pond Road/Freshwater Road spills back into the intersection of Elizabeth Avenue/Freshwater Road. This spill back impacts the operations at the Elizabeth Avenue/Freshwater Road intersection; further study should be completed to develop a solution for the same.

### 2.2 Detailed Traffic Analysis

A detailed analysis was conducted for 6 study area intersections. This analysis used traffic volumes that factored existing counts up by an agreed amount to reflect anticipated growth. Redistribution of traffic patterns expected to occur with the completion of the Team Gushue Highway was evaluated but no modifications were made to reflect a conservative approach. The new development site traffic was also added to the volumes. These volumes were prepared by Hatch Mott MacDonald, approved by the City of St. John's and provided to HTC to complete the detailed analysis.

The traffic analysis for this detailed traffic analysis was completed using the Synchro/SimTraffic (Version 9) software package and the ARCADY/Junctions 8 software. The Synchro/SimTraffic software was used as the main evaluation tool for the signalized and unsignalized intersections level of service analysis completed for this report. The ARCADY/Junctions 8 software was used to analyze the level of service for the suggested locations for roundabouts. An explanation of the intersection performance measures has been previously provided in Section 1.5 of the report.

### 2.2.1 Detailed Analysis Scenarios

Two different network scenarios were completed for this detailed traffic analysis for both the AM and PM peak hours at the 6 identified intersections noted in Figure 1. These scenarios included:

- Scenario 1 - Conditions expected to be present in 2025 based on the existing traffic volumes with a factor of $0.8 \%$ per year to reflect the normal background traffic growth and the new Core Science Facility development.
- Scenario 2 - Same traffic volumes as Scenario 2 with improvements to the study network.

### 2.2.2 Development added to the Network

The study team interviewed both Darrell Miles with MUN Facilities Management, and Mr. Joe Dunford with Eastern Health to get a sense of the anticipated capital works plans for both Eastern Health and the University over the next 10 years (2015-2025).

From the information gathered during these interviews, it would appear as though the only significant development expected over the next 10 years in the study area will be the Core Science Facility which is expected to start construction in September of 2015. The proposed development trip generation rates are shown below in Table 3.

Table 3: Trip Generation Rates - Core Science Facility

| VISUM <br> Zone | Use | Number | Unit | $\begin{array}{\|c\|} \hline 1000 \mathrm{sq} \mathrm{ft} \\ \text { GFA * } \\ \text { Coverage } \end{array}$ | ITE Code | AM Peak Trip Gen | AM Peak Total In | AM Peak Total Out | PM Peak Trip Gen | PM Peak Total In | PM Peak <br> Total Out |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| PROPOSED DEVELOPMENT (2015-2025) |  |  |  |  |  |  |  |  |  |  |  |
| Zone 229 | Core Science Facility | 300,000 | sq. ft | 300 | 540 | 897 | 664 | 233 | 762 | 442 | 320 |
| Zone 229 | Core Science Facility | 500 | students |  | 550 | 105 | 84 | 21 | 105 | 32 | 74 |
| Proposed Development Total |  |  |  |  |  | 1002 | 748 | 254 | 867 | 473 | 394 |

The table above captures the two elements of the Core Science Facility. This facility has approximately 480,000 gross square feet of space, both office and student oriented functions.

After completion of this analysis, the construction of a new Animal Rescue Centre was identified. This is expected to be completed in 2018 and will be approximately 35,000 gross square feet. Trips to this centre are not expected to significantly impact the conclusions of this report.

### 2.2.3 Scenario 1 - 2025 Traffic Volumes

Scenario 1 is an analysis of the future conditions at the 6 intersections which includes the existing lane configuration, future traffic volumes and an optimized signal timing plan at this intersection. The traffic volumes that were used in the Scenario 1 analysis to reflect normal background traffic growth to the year 2025 ( $0.8 \%$ per year) and the new Core Science Facility development. The future traffic volumes at the 6 selected intersections are shown in Figure 6.

Figure 6：Scenario 1 －Traffic Volumes AM（PM）

HTC used Synchro／SimTraffic（v9）to analyze the Scenario 1 conditions at the 6 intersections．Table 4 and Table 5 shown below，reflects the AM and PM peak hour results of that analysis．It provides the level of service（LOS），delay per vehicle，volume to capacity（ $\mathrm{v} / \mathrm{c}$ ）ratio and the queue length of each approach movement to the intersection．The detailed Synchro／SimTraffic results can be found in Appendix F．

Table 4: Scenario 1 - Traffic Volumes - AM Peak Hour - Synchro/SimTraffic Analysis Results

Table 5: Scenario 1 - Traffic Volumes - PM Peak Hour - Synchro/SimTraffic Analysis Results

### 2.2.4 Discussion of the Results - Scenario 1

The Scenario 1 LOS results noted above show that some of the study intersections perform with movements operating at LOS E or F and are nearing capacity. The detailed descriptions of each intersection are below.

## Columbus Drive/Prince Philip Drive \& Thorburn Road

As indicated in the results above, the AM peak hour has an overall intersection LOS F and is over capacity. The eastbound left-turn and through movement and the southbound left-turn movement operate at LOS F and are over capacity. The SimTraffic analysis indicates the intersection is operating at an overall LOS F and the southbound approach operates at LOS F.

In the PM peak hour the eastbound left-turn movement and the southbound left-turn movement operates at LOS F and is over capacity. The PM peak hour an overall intersection LOS D. The SimTraffic analysis indicates the intersection is operating at an overall LOS $F$ with the westbound through movement and southbound right-turn operating at LOS F.

## Prince Philip Drive \& Clinch Crescent/Westerland Road

As indicated in the results above, the AM peak hour has an overall intersection LOS F and is over capacity. The eastbound left-turn movement, westbound through and right-turn movement and the northbound through movement operate at LOS F and are over capacity. The SimTraffic analysis indicates the intersection is operating at an overall LOS F and multiple movements operating at LOS F.

In the PM peak hour, the eastbound left-turn movement, the westbound through and right-turn movements, the northbound left-turn movement and the southbound right-turn movement operates at LOS F and are over capacity. Similar to the AM peak hour, the SimTraffic analysis in the PM peak hour indicates the intersection is operating at an overall LOS F with multiple movements operating at LOS F.

## Prince Philip Drive \& Allandale Road

As indicated in the results above, the AM peak hour has an overall intersection LOS D and the eastbound left-turn and northbound left-turn movements operate at LOS F. The westbound through and right-turn movement and the southbound through movement operate at LOS E. The SimTraffic analysis indicates the intersection is operating at an overall LOS F and westbound approach and northbound left-turn movement operating at LOS F and northbound through movement operates at LOS E.

In the PM peak hour, the eastbound left-turn movement, the northbound left-turn and through movements and southbound through movement operates at LOS F and are over capacity. The southbound left-turn movement operates at LOS E. The SimTraffic analysis in the PM peak hour indicates the intersection is operating at an overall LOS F with multiple movements operating at LOS E or F .

## Bonaventure Avenue/Allandale Road \& Elizabeth Avenue

As indicated in the results above, the AM peak hour has an overall intersection LOS D and the northbound through movement operates at LOS E and the southbound left-turn movement operates at LOS F. The SimTraffic analysis indicates the intersection is operating at an overall LOS D and northbound
left-turn and through movements operating at LOS F and northbound right-turn movement operates at LOS E.
In the PM peak hour, the eastbound through and right-turn movements and the northbound through movements operates at LOS E. The southbound left-turn movement operates at LOS F. The SimTraffic analysis in the PM peak hour indicates the intersection is operating at an overall LOS F with multiple movements operating at LOS E or F.

## Elizabeth Avenue \& Westerland Road

As indicated in the results above, the AM peak hour has an overall intersection LOS D and the eastbound left-turn movement and the westbound through/right-turn movement operates at LOS E. The SimTraffic analysis indicates the intersection is operating at an overall LOS E and the eastbound approach operates at LOS F and the westbound approach operates at LOS E.

In the PM peak hour, the southbound left-turn movement operates at LOS E and all other approaches operate at LOS D or higher. The SimTraffic analysis in the PM peak hour indicates that all approaches operate at LOS D or higher.

## Elizabeth Avenue \& Freshwater Road

As indicated in the results above, in both the AM and PM peak hours, all approaches at the intersection operates at LOS D or higher, which is considered acceptable. It should be mentioned that traffic currently spills back during both peak periods from the Oxen Pond Intersection with Freshwater and affects the operation at Freshwater Road and Elizabeth Avenue. So, while the detailed analysis shows a good level of service, things are likely to be much worse because of the operational problems at the Freshwater Road intersection with Oxen Pond Road. Further study of Oxen Pond Road/Freshwater Road intersection should be completed to identify and remediate the operational issues.

### 2.2.5 Improvement Options

HTC modified five of the six intersections to either include a multi-lane roundabout or modifications to the intersection. Three intersections were analyzed as multi-lane roundabouts, which include the intersections along Prince Philip Drive at Thorburn Road, Westerland Road and Allandale Road. Two intersections along Elizabeth Avenue were modified to include a longer storage lane and a channelized right-turn. Each intersection is described below of the options that were used to improve the intersections.

## Columbus Drive/Prince Philip Drive \& Thorburn Road

HTC modified the intersection of Prince Philip Drive/Columbus Drive and Thorburn Road in an effort to improve the LOS on individual intersection approaches. HTC added a dual left-turn lane on the Columbus Drive approach to the intersection. HTC also optimized the splits and the cycle length for the intersection, in both the AM and PM peak hour models. None of these improvements were able to deal effectively with the LOS issues. This intersection is clearly over capacity under the 2025 traffic volumes in both the AM and PM peak hours. Simple timing, phasing and cycle length adjustments are not viable options to deal with the LOS problems being experienced at this intersection.

Accordingly, HTC decided to examine the use of a multi-lane roundabout as the method of traffic control at this intersection.

Prince Philip Drive \& Clinch Crescent/Westerland Road
HTC modified the intersection of Prince Philip Drive and Clinch Crescent/Westerland Road to improve the LOS on individual approaches of the intersection. HTC increased the cycle length to 120 seconds and also added a dual left-turn lane from Prince Philip Drive onto Clinch Crescent with the additional receiving lane dropping at Arctic Avenue. After optimizing the splits for the intersection, all approaches affected remained at LOS E or F. None of the improvements were able to deal effectively with the LOS issues. This intersection, again, is clearly over capacity under the 2025 traffic volumes in both the AM and PM peak hours. Simple timing, phasing, and cycle length changes and minor geometric adjustments are not viable options to deal with the LOS problems being experienced at this intersection. Accordingly, HTC turned to different means of traffic control - a multi-lane roundabout. This configuration was used in our analysis to determine if the level of service would improve in Scenario 2.

## Prince Philip Drive \& Allandale Road

HTC modified the intersection of Prince Philip Drive and Allandale Road to try and improve the LOS on individual approaches to the intersection. HTC increased the cycle length to 120 seconds and also added a dual left-turn lane from Prince Philip Drive onto Allandale Road and a dual left-turn from Allandale Road onto Prince Philip Drive. After optimizing the splits for the intersection, in both the AM and PM peak hours, the level of service at the multiple approaches still operate at LOS E. Therefore, increasing the cycle length and adding the dual left-turns lane did improve the level of service, but those approaches remain at LOS E and have no residual capacity. Accordingly, HTC turned to different means of traffic control for this intersection - a multi-lane roundabout. This configuration was used in our analysis to determine if the level of service would improve in Scenario 2.

## Bonaventure Avenue/Allandale Road \& Elizabeth Avenue

HTC modified the intersection of Elizabeth Avenue and Allandale Road/Bonaventure Avenue to improve the LOS at individual approaches. HTC added an additional through lane on the northbound approach and combined it with the existing right-turn lane on Bonaventure Avenue. HTC also extended the southbound left-turn storage lane on Allandale Road to 100 m . After optimizing the splits for the intersection, in both the AM and PM peak hours, the level of service at the intersection operates with all movements at LOS D or higher. Therefore, HTC proceeded with these improvements and the intersection was analyzed in Synchro/SimTraffic to determine if the level of service would improve; Scenario 2.

## Elizabeth Avenue \& Westerland Road

HTC modified the intersection of Elizabeth Avenue and Westerland Road to improve the LOS at individual approaches. HTC added a channelized right-turn with a storage lane of 50 m on the westbound approach on Elizabeth Avenue. After optimizing the splits for the intersection, in both the AM and PM peak hours, the level of service at the intersection operates with all movements at LOS D or higher, except for the southbound left-turn movement. Therefore, this improvement was analyzed in Synchro/SimTraffic to determine if the level of service would improve, Scenario 2.

Elizabeth Avenue \& Freshwater Road
Due to the intersection operating at acceptable LOS in the future scenario, improvements were not considered for this intersection.

### 2.2.6 Advantages of Roundabouts

There are many advantages to using roundabouts and the most relevant to this project are listed below:

## Vehicle Safety:

- When vehicles are using a roundabout there are only 8 potential conflict points compared to 32 potential conflict points in a signalized intersection.
- The driver of the vehicle only needs to look left when entering the intersection.
- The geometrics of a roundabout require the motorists to slow to a speed of $30-40 \mathrm{~km} / \mathrm{hr}$ when entering and exiting the roundabout.
- Roundabouts are used as a traffic calming option.
- Accidents at roundabout tend to be less frequent and less severe than that of signalized intersections.

## Pedestrian \& Bicycle Safety:

- When a pedestrian crosses the approach leg to the roundabout, they are faced only with one direction of traffic and a single crossing at a time, of only one or two lanes of traffic.
- Between crossings, pedestrians will be accommodated on refuge islands or sidewalk before making their next crossing.
- Approaching drivers are forced to slow as they approach the roundabout, which enables them to be able to react and stop quickly to yield to pedestrians.
- Bicyclists have an option of travelling through the roundabout or proceeding to the crosswalk.

Traffic Operations:

- When vehicles enter the roundabout, they are approaching and yielding to the traffic on the inner circle.
- When a gap is available, the motorist may proceed in a counter-clockwise manner and exit on the appropriate leg.
- Without an automated signal control, drivers are able to judge for gaps and enter the intersection, rather than being forced to wait for a green light. This optimizes the overall intersection efficiency and reduces delay when compared a signalized or a stop-controlled intersection.
- Strategically placed roundabouts can be used as part on an overall access management plan to reduce the conflicts on a roadway created by left turning traffic.

## Community and Environment Impacts:

- The central island areas of a roundabout can be landscaped or enhanced to become signature gateways.
- Vehicles tend to be able to proceed through a roundabout with less delay, resulting in a reduction in the amount of emissions and fuel consumed.

Overall, roundabouts are a safer more efficient method of traffic control that significantly reduce the delay traditionally experienced by signalized intersections.

### 2.2.7 Scenario 2 - 2025 Traffic Volumes with Improvements

Scenario 2 is an analysis of the future conditions at the six intersections with the same future traffic volumes as Scenario 1 (Figure 6). This scenario also includes the improvements completed at each intersection either using ARCADY/Junctions 8 software to analyze the intersection as a multi-lane roundabout or Synchro/SimTraffic to analyze the signalized intersection. The ARCADY/Junctions 8 analysis reflects components of the geometric design such as entry width, flare lengths, entry radius and inscribed circle diameter. The results of the analysis are shown in Table 6 below and can be found in Appendix $G$.

Table 6: Scenario 2 - Future Traffic Volumes with Improvements - Arcady Analysis Results

|  | AM |  |  |  |  |  | PM |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { Queue } \\ & \text { (PCE) } \end{aligned}$ | $\begin{aligned} & \text { Delay } \\ & (s) \end{aligned}$ | $\begin{aligned} & \text { V/C } \\ & \text { Ratio } \end{aligned}$ | Los | Intersection Delay (s) | $\begin{aligned} & \text { Intersection } \\ & \text { LOS } \end{aligned}$ | $\begin{aligned} & \text { Queue } \\ & \text { (PCE) } \end{aligned}$ | Delay (s) | v/c <br> Ratio | LOS | Intersection Delay (s) | $\begin{aligned} & \text { Intersection } \\ & \text { LOS } \end{aligned}$ |
|  | Prince Philip-Columbus-Thorburn - 2025 |  |  |  |  |  |  |  |  |  |  |  |
| Thorburn Road | 3.01 | 7.46 | 0.75 | A | 10.45 | B | 9.58 | 26.20 | 0.92 | D | 10.67 | B |

| Connection to Freshwater | 0.94 | 10.17 | 0.49 | B |  |  | 0.75 | 4.67 | 0.43 | A |  |  |
| Prince Philip | 0.68 | 3.01 | 0.41 | A |  |  | 3.23 | 7.91 | 0.77 | A |  |  |
|  | AM |  |  |  |  |  | PM |  |  |  |  |  |
|  | Queue <br> (PCE) | Delay (s) | $\underset{\text { Ratio }}{\text { V/C }}$ | LOS | Intersection Delay (s) | $\begin{array}{\|c\|} \hline \begin{array}{c} \text { Intersection } \\ \text { LOS } \end{array} \\ \hline \end{array}$ | Queue (PCE) | Delay (s) | $\underset{\text { Ratio }}{\text { v/C }}$ | LOS | Intersection Delay (s) | Intersection LOS |
|  | Prince Philip-Clinch-Westerland - 2025 |  |  |  |  |  |  |  |  |  |  |  |
| Prince Philip (Westside) | 19.61 | 34.49 | 0.97 | D | 21.58 | c | 7.78 | 16.57 | 0.89 | C | 11.13 | B |
| Westerland | 1.58 | 6.71 | 0.62 | A |  |  | 1.03 | 5.44 | 0.51 | A |  |  |
| Prince Philip (Eastside) | 5.65 | 14.88 | 0.86 | B |  |  | 2.72 | 6.57 | 0.73 | A |  |  |
| Clinch Cres | 0.23 | 2.79 | 0.18 | A |  |  | 3.51 | 12.17 | 0.78 | B |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |
|  | AM |  |  |  |  |  | PM |  |  |  |  |  |
|  | $\begin{aligned} & \text { Queue } \\ & \text { (PCE) } \end{aligned}$ | Delay (s) | $\begin{aligned} & \text { V/C } \\ & \text { Ratio } \end{aligned}$ | LOS | Intersection Delay (s) | $\begin{aligned} & \text { Intersection } \\ & \text { LOS } \end{aligned}$ | $\begin{aligned} & \text { Queue } \\ & \text { (PCE) } \end{aligned}$ | Delay <br> (s) | $\begin{array}{\|c\|c\|} \hline \text { V/C } \\ \text { Ratio } \end{array}$ | LOS | Intersection Delay (s) | $\begin{aligned} & \text { Intersection } \\ & \text { LOS } \end{aligned}$ |
|  | Prince Philip-Allandale - 2025 |  |  |  |  |  |  |  |  |  |  |  |
| Prince Philip (Westside) | 1.84 | 5.14 | 0.65 | A | 4.30 | A | 17.18 | 28.94 | 0.96 | D | 24.57 | c |
| Allandale (Southside) | 0.91 | 3.96 | 0.48 | A |  |  | 8.98 | 31.14 | 0.92 | D |  |  |
| Prince Philip (Eastside) | 1.42 | 4.89 | 0.59 | A |  |  | 1.76 | 6.69 | 0.64 | A |  |  |
| Allandale (Northside) | 0.55 | 3.47 | 0.36 | A |  |  | 0.00 | 0.00 | 0.00 | A |  |  |

As shown above in Table 6, all three intersections in both the AM and PM peak hours have an overall intersection LOS D or higher, which is considered acceptable. Please note that the queue lengths are measured as PCE (passenger car equivalent), with one vehicle assumed to be 7.0 m long.

For the Synchro analysis of the intersection at Elizabeth Avenue/Allandale Road and Elizabeth Avenue/Westerland Road, in both the AM and PM peak hours, show that all movements are operating at LOS D or higher, which is acceptable. The only exception is in the AM peak hour, at Elizabeth Avenue/Westerland Road the southbound left-turn movement operating at LOS E.

The SimTraffic analysis indicates that in the AM peak hour both intersections operate at LOS D or better, which is considered acceptable. In the PM peak hour, the eastbound approach and the northbound leftturn movement operates at LOS E.

Table 7: Scenario 2 - Future Traffic Volumes with Improvements - AM Peak Hour - Synchro/SimTraffic Analysis Results

Table 8: Scenario 2 - Future Traffic Volumes with Improvements - PM Peak Hour - Synchro/SimTraffic Analysis Results

### 2.2.8 Estimated Costs - Detailed Analysis

The estimate cost of the conceptual improvements associated with the detailed analysis are noted below in Table 9. HTC has also provided a priority plan for these different projects. It is recommended that the City of St. John's proceed to the preliminary design stage to obtain more accurate costing for budgetary purposes. The total cost of the improvements associated with the detailed analysis is $\$ 4.95$ million dollars.

Table 9: Detailed Analysis Cost

|  | Detailed Analysis |  |  |
| ---: | ---: | ---: | ---: |
| Priority | $\$$ | $1,600,000$ |  |
| 1 | Prince Philip Drive \& Allandale Road | $\$$ | $1,200,000$ |
| 2 | Prince Philip Drive \& Clinch Crescent/Westerland Road | $\$$ | $1,800,000$ |
| 3 | Prince Philip Drive/Columbus Drive \& Thorburn Road | $\$$ | 200,000 |
| 4 | Elizabeth Avenue \& Allandale Road/Bonaventure Avenue | $\$$ | 150,000 |
| 4 | Elizabeth Avenue \& Westerland Road | $\$ 4,950,000$ |  |
| Total Cost of Detailed Analysis | $\$$ |  |  |

### 2.2.9 Findings/Recommendations - Detailed Analysis

The traffic volumes that were used in the Scenario 1/Scenario 2 analyses reflect normal background traffic growth to the year 2025 ( $0.8 \%$ per year), and the traffic volumes associated with the new Core Science Facility development. HTC used the Synchro/SimTraffic software and Arcady/Junctions software packages to complete our LOS analysis work.

There were six intersections included within the detailed analysis work. These intersections included:

- Prince Philip Drive/Columbus Drive \& Thorburn Road
- Prince Philip Drive \& Clinch Crescent/Westerland Road
- Prince Philip Drive \& Allandale Road
- Elizabeth Avenue \& Allandale Road/Bonaventure Avenue
- Elizabeth Avenue \& Westerland Road
- Elizabeth Avenue \& Freshwater Road

## Prince Philip Drive/Columbus Drive \& Thorburn Road

The intersection of Prince Philip Drive and Thorburn Road is one the largest most complex intersections that the City of St. John's controls. This intersection already has three through lanes in both the north and southbound directions and a dual left turning lane on Thorburn Road. The results of our analysis indicates that little or nothing can be done with the present method of traffic control at this intersection in terms of signal timing, phasing, cycle length changes or with auxiliary lane additions that will provide an acceptable level of service at this intersection in either of the analysis periods for 2025. Our analysis using a multi-lane roundabout as the method of traffic control yielded acceptable results in terms of the LOS during both analysis periods.

Accordingly, our recommendation is to reconfigure the intersection to a multi-lane roundabout as shown in Figure 7. The estimated cost of upgrading this intersection is estimated at $\$ 1.8$ million dollars.

Figure 7: Prince Philip Drive/Columbus Drive \& Thorburn Road proposed multi-lane roundabout

Please note that HTC has prepared this conceptual design bearing in mind the location of the structures for O'Leary's Avenue Brook and the abutment of the Columbus Drive overpass.

## Prince Philip Drive \& Clinch Crescent/Westerland Road

The intersection of Prince Philip Drive and Clinch Crescent/Westerland Road is also a major intersection for the City of St. John's. It provides a secondary access to the Health Sciences complex from Prince Philip Drive and provides both vehicular and pedestrian connections to both sides of campus. The result of our analysis, again, indicate that little or nothing can be done with the present method of traffic control at this intersection in terms of signal timing, phasing, cycle length changes or with auxiliary lane additions that will provide an acceptable level of service at this intersection in either of the analysis periods for 2025. Our analysis using a multi-lane roundabout as the method of traffic control yielded acceptable results in terms of the LOS during both analysis periods.

Our recommendation is to reconfigure this intersection to a multi-lane roundabout. The estimated cost based on the conceptual layout in Figure 8 to construct a multi-lane roundabout at this location would be \$1.2M.

Figure 8: Prince Philip Drive \& Clinch Crescent/Westerland Road proposed multi-lane roundabout
This conceptual design does not match with the long term conceptual plan developed for this intersection. This intersection was configured as a 3-legged roundabout with Westerland Road being closed to through traffic. Also, the location of the proposed 4 -legged roundabout is aligned with the existing roadways, whereas the 3-legged roundabout was pushed towards Westerland Road to accommodate the proposed roundabout at Clinch Crescent/Arctic Avenue. The detailed design of this proposed roundabout should allow for a potential reconfiguration in the future to reflect the suggested closure of Westerland Road.

## Prince Philip Drive \& Allandale Road

The intersection of Prince Philip Drive and Allandale is again a very large, somewhat complicated signalized intersection with heavy traffic flows on most approaches of the intersection. This intersection also has a high collision rate - 98 traffic collisions over a 3 year period (2009-2011). The results of our analysis, again, indicates that little or nothing can be done with the present method of traffic control at this intersection in terms of signal timing, phasing, cycle length changes or with auxiliary lane additions that will provide an acceptable level of service at this intersection in either of the analysis periods for 2025. Our analysis using a multi-lane roundabout as the method of traffic control yielded acceptable results in terms of the LOS during both analysis periods.

Based on the conceptual plan shown in Figure 9, HTC are estimating the cost to build this multi-lane roundabout at $\$ 1.6 \mathrm{M}$. Please note that the southbound right-turn by-pass lane is not required in the high level analysis.

Figure 9: Prince Philip Drive \& Allandale Road proposed multi-lane roundabout

## Elizabeth Avenue \& Allandale Road/Bonaventure Avenue

The intersection of Elizabeth Avenue and Allandale is also a busy signalized intersection located at the eastern boundary of the study area. The results of our analysis indicate that the traffic volumes projected or forecasted to be present at this intersection can work under a signalized intersection control configuration. Some timing changes and some geometric lane improvements will be necessary, which includes lengthening the southbound left-turn storage lane and changing the northbound rightturn lane into a shared through/right-turn lane.

Based on this conceptual plan shown in Figure 10, HTC are estimating the cost of the proposed geometric changes to this intersection will be approximately $\$ 200,000$.

Figure 10: Elizabeth Avenue \& Allandale Road/Bonaventure Avenue proposed improvements

## Elizabeth Avenue \& Westerland Road

The Elizabeth Avenue intersection with Westerland Road is one of the smaller intersections included within this detailed analysis. Our analysis of the 2025 peak hour volumes indicates that an acceptable LOS can be achieved with a minor geometric improvements (the addition of an auxiliary right turn lane in the westbound direction) and some timing changes to the controller. The estimated cost based on the conceptual design shown in Figure 11 is estimated at $\$ 150,000$.

Figure 11: Elizabeth Avenue \& Westerland Road proposed improvements

This design should be considered for the short term fix. It does not match with the long term concept plan developed for this area of the study in section 2.3 .8 of the report. The long term goal involves removing this intersection totally from the road network.

## Elizabeth Avenue \& Freshwater Road

The analysis work completed by HTC at the intersection of Elizabeth Avenue Road and Freshwater Road shows that this intersection functions well during both analysis periods of 2025.

It should be mentioned that traffic currently spills back during both peak periods from the Oxen Pond Intersection with Freshwater and affects the operation at Freshwater Road and Elizabeth Avenue. So, while the detailed analysis shows a good level of service, things are likely to be much worse because of the operational problems at the Freshwater Road intersection with Oxen Pond Road. A further study of Oxen Pond Road/Freshwater Road intersection should be completed to identify and remediate the operational issues.

The results of this detailed analysis clearly indicate that the three intersections along Prince Philip Drive will be over capacity by the year 2025 in both analysis periods. The recommendations are largely the same as those identified as being required in the long term analysis. All concept improvement drawings can be found in Appendix H.

Should be noted that while only minor improvements are suggested along Elizabeth Avenue at the detailed analysis area intersections, the volumes are not significantly different than those used in the high level analysis. Single lane volumes of 650-850 vehicles per hour, do not leave much spare capacity for unanticipated or expected growth in volumes. Much of the public feedback HTC has taken in from this project, indicates that pedestrian safety is a major concern along Westerland Road and hence the comments and concepts that were developed in section 3.1 of report still apply. HTC remain of the opinion that in the long term the segment of Westerland Road from Prince Philip Drive to Elizabeth Avenue should be removed from service altogether.

HTC also heard during the public consultation process that that many people, including the administration of the campus, did not want to see any widening of Elizabeth Avenue. This was a significant influencing factor in our rationale to provide a roundabout corridor along Elizabeth Avenue in the long term. The traffic flow can be handled without any widening. HTC provided a raised median in the centre of Elizabeth Avenue and an AT trail along the north side of the road. In HTC's opinion, maintaining a conventional corridor of signals will not facilitate that vision.

### 2.3 High Level Traffic Analysis

A high level traffic analysis was conducted for the entire study areas, which included 20 unsignalized and signalized intersections. This analysis used the VISUM models to obtain the approach movement traffic volumes at all intersections included within the study area for both the AM and PM peak hours.

The traffic analysis for the high level traffic analysis was completed using the Synchro/SimTraffic (Version 9) software package and the ARCADY/Junctions 8 software. The Synchro/SimTraffic software was used as the main evaluation tool for the signalized and unsignalized intersections level of service analysis completed for this report. The ARCADY/Junctions 8 software was used to analyze the level of service for the suggested locations for roundabouts. An explanation of the intersection performance measures has been previously provided in Section 1.5 of the report.

### 2.3.1 Traffic Analysis - VISUM Model

As indicated previously, VISUM is a macroscopic transportation planning modelling software package that is used to model transportation networks and travel demand to forecast traffic flows under a different network conditions. In 2011, the City of St. John's developed a number of regional VISUM transportation planning models including models for the AM and PM peaks hours for traffic conditions present in 2010, 2015 and 2025. For the purposes of completing this study, the study team used an updated version of the 2025 model to complete the required analysis which includes commercial, industrial and residential development that is likely to occur in the St. John's Metro area by the year 2025. It also includes new road infrastructure such as the Team Gushue Highway that are expected to be completed by that time frame. The 2025 VISUM model used for the purposes of this analysis included the main developments in the following areas of the St. John's Metropolitan Area:

- Southlands (assumption made full build-out by 2025)
- Glencrest Development - Portions of the development (assumptions made for $1 / 3$ of the full build out values in year 2025)
- St. John's Land Use Development Plan - lands above the 190 m Contour (assumptions made for $1 / 3$ of the full build out values in year 2025)
- Paradise Zones (2025 growth scenario used from the Paradise Improvement Plan)

## Model Calibration in the Immediate Study Area

For the purposes of this study, HTC's modelling staff had a detailed look at the zones in the immediate area of the University to ensure they were coded correctly in the original model production and to ensure they were indeed functioning and generating traffic properly. Traffic analysis zones (TAZ's) 227, 228, 230, 231 and 402 were examined and adjusted accordingly to reflect the existing uses in each of these zones. For the above noted TAZ's, the ITE trip generation rates were used instead of the standard VISUM model zone inputs. Factors were then applied to the trip generation rates to balance them with existing volumes at key entrance and exit locations within the network. Reference Appendix B for details in this regard. The detailed spreadsheet of the ITE trip generation rates calculated for the campus area traffic analysis zones is contained in Appendix B.

The ITE trip generation rates were used over the standard travel demand model's default inputs for just the project zones rather than all zones of the model. To use ITE trip rates within the VISUM model, an additional modeling step has to be inserted before traffic assignment but after trip distribution and mode split. HTC adjusted the model produced origin-destination matrices using the Furness method so that the total number of trips in and out of the project zones matches the control total calculated from ITE trip
generation. This step changes the magnitude of the matrices but is able to retain the model predicted trip distribution pattern. (i.e., 20\% going north, $50 \%$ going south, etc.). The ITE-modified origin-destination matrices are then assigned onto the transportation network to get the link and turning movement volumes. This approach has several advantages over other traffic impact assessment method including:

- The ability to retain the trip distribution pattern as predicted by the model. Manual distribution tends to over-simplify the reality.
- The ITE trip rates, are more suitable for traffic operations/capacity analysis at the link/turning movement level.
- The ability to use more advanced traffic assignment methods (stochastic assignment) to capture a wider range of route choice options.

### 2.3.2 High Level Analysis Scenarios

Section 4.05 of the terms of reference for this project specified that the study team was to examine a total of 5 different network conditions scenarios. These scenarios included:

- Existing conditions.
- A year 2015 projection of normal growth with no development in the study area.
- A year 2015 projection of normal growth with the anticipated level of development during that time frame in the study area. This would be without any network improvements including auxiliary lane additions or improvements and traffic signal timing and or phasing changes.
- A year 2015 year projection of normal growth with the anticipated level of development in the study area during that time frame with network improvements such as auxiliary lane additions or improvements and traffic signal timing and or phasing changes in place.
- A year 2025 projection of normal growth with the anticipated level of development in the study area including the improvements noted in the previous condition but also including the widening of Elizabeth Avenue and a proposed link from the Allandale Road Interchange with the Outer Ring Road and Clinch Crescent.

Upon closer examination of the scenarios referenced in the study's terms of reference, the study team recommended that the original scenarios be replaced by the scenarios noted below. In essence, all the 2015 VISUM modelling scenarios were replaced by similar 2025 VISUM modelling scenarios. These modelling scenario changes were approved by the project steering committee.
In total there were five different modelling scenarios used in the course of completing the analysis for this study. These scenarios included:

- Scenario 0: Existing conditions (Shown in Section 2.1).
- Scenario 1: 2025 Projection of normal growth with no new development in the study area.
- Scenario 2: 2025 Projection of normal growth with no new development in the study area with improvements to the road network such as auxiliary lanes, and/or intersection signal timing/phasing improvements.
- Scenario 3: 2025 Projection of normal growth with new development in the study area with improvements to the road network such as auxiliary lanes, and/or intersection signal timing/phasing improvements.
- Scenario 4: 2025 Projection of normal growth with new development in the study area with improvements to the road network (such as auxiliary lanes, signal timing improvements or phasing). This scenario also includes the widening of Elizabeth Avenue and a proposed link from the Allandale Road Interchange with the Outer Ring Road and Clinch Crescent.

A long term analysis was completed for the study area network based on traffic volumes derived from the VISUM model outputs.

### 2.3.3 Scenario (S1) - 2025 Normal Growth with No Development

The Scenario (S1) model is based on normal growth that is projected to occur regionally to the year 2025. It includes planned growth in the region but does not include any of the planned development in the MUN area. The VISUM models were used to obtain the approach movement traffic volumes at all intersections included within the study area for both the AM and PM peak hours. These traffic volumes were then analyzed/modelled using the Synchro and SimTraffic software.

## Discussion of the Results

The LOS results during both the AM and PM peak hour periods at all intersections with the study area for Scenario S1 are discussed below. For the most part, many of the intersections within the study area have one or more movements are that are performing poorly and predominantly so, in the PM peak hour. The following 13 signalized and unsignalized intersections have an overall LOS of E or F in the PM peak hour:

- Columbus Drive/Prince Philip Drive \& Thorburn Road
- Prince Philip Drive \& Clinch Crescent
- Prince Philip Drive \& Clinch Crescent/Westerland Road (AM \& PM peak hours)
- Clinch Crescent \& Arctic Avenue
- Prince Philip Drive \& Allandale Road (AM \& PM peak hours)
- Bonaventure Avenue/Allandale Road \& Elizabeth Avenue
- Westerland Road \& Elizabeth Avenue
- Anderson Avenue \& Elizabeth Avenue
- Freshwater Road \& Elizabeth Avenue
- Freshwater Road \& Stamps Lane/Oxen Pond Road (AM \& PM peak hours)
- Freshwater Road \& Thorburn Road
- Outer Ring Road NB \& Allandale Road (AM \& PM peak hours)
- Outer Ring Road SB \& Allandale Road present on one or more approaches at most intersections.

The main difference between Scenario (S0) and Scenario (S1) is the increase in the traffic volumes on the road network expected to occur over an 11 year timeframe: 2014-2025. These increases can be attributed
to normal yearly growth, and to new residential and commercial developments in the region. The existing road network configuration in the MUN Study area is expected to be over capacity by the year 2025. Improvements will be required.

### 2.3.4 Scenario (S2) - 2025 Traffic Volumes with No Development with Improvements

Scenario (S2) is very much similar to the (S1) scenario described previously. It includes the normal growth that is expected to occur on the road network to the year 2025, but also includes minor improvements in the analysis, such as additional auxiliary lanes and adjusted/optimized signal timings. The traffic volumes for the (S2) scenario were analyzed again using the Synchro and SimTraffic software.

## Improvements to the Study Network

All of the signalized intersections within the study area required adjusted signal timings and offsets to better control the new volumes on the study area network. The new signal timings and offsets values were obtained from the optimization features of the Synchro/SimTraffic software. The only minor lane change made in the network was at the intersection of Mt. Scio Road and Allandale Road. Here the lane configuration was changed to provide separate left and through/right lane groups on the Mt. Scio Road approaches to the intersection. Figure 12 shows the improvements in red.

Figure 12: Reconfigured Intersection - Mt. Scio @ Allandale Road

## Discussion of the Results

The LOS results during both the AM and PM peak hour periods at all intersections within the study area for Scenario (S2) are described below. As seen previously in the Scenario (S1) results, many of the intersections within the study area have one or more movements are that are performing poorly and predominantly so,
in the PM peak hour. The following 12 signalized intersections and/or unsignalized intersections have an overall LOS of E or F in the PM peak hour.

- Columbus Drive/Prince Philip Drive \& Thorburn Road
- Prince Philip Drive \& Clinch Crescent
- Prince Philip Drive \& Clinch Crescent/Westerland Road (AM \& PM peak hours)
- Clinch Crescent \& Arctic Avenue
- Prince Philip Drive \& Allandale Road
- Bonaventure Avenue/Allandale Road \& Elizabeth Avenue
- Westerland Road \& Elizabeth Avenue
- Anderson Avenue \& Elizabeth Avenue
- Freshwater Road \& Elizabeth Avenue
- Freshwater Road \& Stamps Lane/Oxen Pond Road
- Outer Ring Road NB \& Allandale Road (AM \& PM peak hours)
- Outer Ring Road SB \& Allandale Road

Even with signal timing changes and minor improvements to the road network the traffic conditions under Scenario (S2) the PM peak hour remain poor with longs delays and congestion present at most intersections on one or more approaches. The poor performance of the study area intersections in scenario (S2) is an indication that additional roadway capacity is required in the study area to accommodate the projected 2025 traffic volumes. Additional roadway capacity can be gained by widening roads and adding additional through lanes or by changing the intersection control method from traffic signals to roundabouts which reduces delay.

Alternatively, transportation demand management tools may be employed to try and reduce the overall amount of traffic projected to be in the study. More people using transit to access the study area would be the obvious solution.

### 2.3.5 Scenario (S3) - 2025 Traffic Volumes with Development with Improvements

Scenario (S3) includes the normal growth expected on the road network to the year 2025, as well as the full build-out of the expected development on campus and in the immediate area expected to occur by that timeframe. The VISUM models were adjusted to reflect the anticipated development and the resulting volumes analysed with the Synchro and SimTraffic software.

## Development added to the Network

The study team interviewed both Darrell Miles with MUN Facilities Management, and Mr. Joe Dunford with Eastern Health to get a sense of the anticipated capital works plans for both Eastern Health and the University over the next 10 years (2015-2025).

From the information gathered during these interviews, it would appear as though the only significant development expected over the next 10 years in the study area will be the Core Science Facility which is expected to start construction in September of 2015.

Table 10: Trip Generation Rates - Core Science Facility

| VISUM <br> Zone | Use | Number | Unit | $\begin{array}{\|c\|} \hline 1000 \mathrm{sq} \mathrm{ft} \\ \mathrm{GFA} \text { * } \\ \text { Coverage } \end{array}$ | ITE Code | AM Peak Trip Gen | AM Peak Total In | AM Peak Total Out | PM Peak Trip Gen | PM Peak Total In | PM Peak Total Out |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| PROPOSED DEVELOPMENT (2015-2025) |  |  |  |  |  |  |  |  |  |  |  |
| Zone 229 | Core Science Facility | 300,000 | sq. ft | 300 | 540 | 897 | 664 | 233 | 762 | 442 | 320 |
| Zone 229 | Core Science Facility | 500 | students |  | 550 | 105 | 84 | 21 | 105 | 32 | 74 |
| Proposed Development Total |  |  |  |  |  | 1002 | 748 | 254 | 867 | 473 | 394 |

To reflect this development, an additional TAZ was created in the VISUM model (Zone 229). The trip generation rates added to the 2025 VISUM model to reflect this development are noted in Table 10 above. Please note the shelled only portion of the Core Sciences Building is expected to be used by the Faculty of Engineering and Applied Sciences attracting approximately 500 new students and 64 new staff members. The multi-point assignments for traffic analysis Zone 229 connect to Artic Avenue. More information can be found in Appendix B.

## Improvements to the Study Network

All of the signalized intersections in the Synchro model for the (S3) scenario required adjustments to both the signal timing splits and offsets to more efficiently handle the new volumes on the study area network. Traffic signals were added at the intersection of Freshwater Road and Elizabeth Avenue. The Mt. Scio Road/Allandale Road intersection maintained the same configuration as was used in Scenario 2 - an exclusive left and through-right lane groups on both the northbound and southbound approaches as shown previously in Figure 12.

## Discussion of the Results

The LOS results during both the AM and PM peak hour periods at all intersections with the study area for Scenario (S3) are described below. Again, many of the intersections within the study area have one or more movements are that are performing poorly and predominantly so, in the PM peak hour. The following 14 signalized intersections and unsignalized intersections have a LOS of E or F in the PM peak hour.

- Columbus Drive/Prince Philip Drive \& Thorburn Road (AM \& PM peak hours)
- Prince Philip Drive \& Clinch Crescent
- Prince Philip Drive \& Clinch

Crescent/Westerland Road (AM \& PM peak hours)

- Clinch Crescent \& Arctic Avenue
- Prince Philip Drive \& Allandale Road (AM \& PM peak hours)
- Bonaventure Avenue/Allandale Road \& Elizabeth Avenue
- Westerland Road \& Elizabeth Avenue
- Anderson Avenue \& Elizabeth Avenue
- Paton Street \& Elizabeth Avenue
- Freshwater Road \& Elizabeth Avenue (AM \& PM peak hours)
- Freshwater Road \& Stamps Lane/Oxen Pond Road
- Allandale Road \& Mt. Scio Road
- Outer Ring Road NB \& Allandale Road
- Outer Ring Road SB \& Allandale Road

The traffic conditions throughout the study area under Scenario (S3) in the PM peak hour are poor with longs delays and congestion prevalent on one or more approaches at most intersections. The spillback queues from several of the larger signalized intersections within the study network are fairly extensive and
result in operational problems and poor levels of service for some adjacent intersections. Overall, the road network conditions under the traffic volumes forecasted for Scenario (S3) are just slightly worse than conditions expected under the traffic volumes forecasted for Scenario (S2) in the PM peak hour. The SimTraffic results show what should be considered as misleading improvements in the LOS at certain key intersections within the road network including Prince Philip Drive at Wicklow and at Clinch Crescent. This is a result of heavy congestion at other intersections that block or interfere with the flow of traffic at these intersections.

Under Scenario (S3), the study area road network is over capacity. Additional roadway capacity is required in order to make any improvements in the overall performance of the intersections within the study area.

### 2.3.6 Scenario (S4) - 2025 Traffic Volumes with Development \& Additional Roadways

Scenario (S4) includes the normal growth expected on the road network to the year 2025, as well as the full build-out of the development on campus and in the immediate area expected to occur by that timeframe. This model also reflects a number of different network configurations. The first network configuration, Option A, includes a new roadway link extending from Clinch Crescent to Mt. Scio Road. It also includes the widening of Elizabeth Avenue to 4 lanes from Allandale Road to Freshwater Road and Stamps Lane. The second network configuration, Option B, also includes a new roadway link extending from Clinch Crescent to Mt. Scio Road but with this option many of the signalized intersections that are suffering from capacity issues have been replaced with new roundabouts, 14 locations in total.

### 2.3.6.1 Option A - New Roadway \& Widening of Elizabeth Avenue

For Scenario (S4) Option A, the traffic volumes were forecasted by the VISUM models and analysed using the Synchro and SimTraffic models.

## Improvements to the Study Network

The improvements that were included in Scenario 4 - Option A, include new signalized intersections and dual left and right turn auxiliary lanes. The signal timings and offsets were optimized for all signalized intersections in the study area road network. The improvements have been made to the study network which are noted below.

## Signalized Intersections:

- Freshwater Road/Elizabeth Avenue
- Clinch Crescent/Arctic Avenue
- Clinch Crescent/New Connection
- Mt. Scio Road/New Connection

## Dual Left or Right Turns:

- Mt. Scio Road/Allandale Road (NB Dual Left)
- Freshwater Road/Elizabeth Avenue (SB Dual Left \& WB Dual Right)
- Clinch Crescent/Prince Philip Drive (SB Dual Right)

## Auxiliary and Additional Through Lanes:

- Mt. Scio Road/Allandale Road (EB right-turn \& SB right-turn \& WB right-turn \& NB right-turn)
- Allandale Road/Prince Philip Drive (EB right-turn)
- Freshwater Road/Elizabeth Avenue (NB right-turn)
- Clinch Crescent/Arctic Avenue (NB right-turn \& SB left-turn)
- Elizabeth Avenue/Allandale Road/Bonaventure Avenue (EB right-turn)
- Freshwater Road/Thorburn Road (WB right-turn extended)
- Elizabeth Avenue (additional through lane added in EB and WB directions from Allandale Road to Freshwater Road)
- Freshwater Road (additional through lane added in NB and SB directions from Elizabeth Avenue to Stamp's Lane)

## Discussion of the Results

The LOS results during both the AM and PM peak hour periods at all intersections within the study area for Scenario (S4) - Option A are shown below. While the changes that were made to the network configuration under Scenario (S4) result in some improvement in the overall performance of the network, there are still many intersections with movements that are performing poorly in both the AM and PM Peak Hour. The following 10 signalized intersections and unsignalized intersections have an overall LOS of E or F in the PM peak hour:

- Columbus Drive/Prince Philip Drive \&

Thorburn Road

- Prince Philip Drive \& Clinch

Crescent/Westerland Road (AM \& PM peak hours)

- Clinch Crescent \& Arctic Avenue (AM peak hour only)
- Prince Philip Drive \& Allandale Road
- Bonaventure Avenue/Allandale Road \& Elizabeth Avenue
- Anderson Avenue \& Elizabeth Avenue
- Freshwater Road \& Elizabeth Avenue
- Freshwater Road \& Stamps Lane/Oxen Pond Road
- Outer Ring Road NB \& Allandale Road (AM \& PM peak hours)
- Outer Ring Road SB \& Allandale Road

Most of the intersections in the study area are handling high traffic volumes under this scenario. The queuing and spillbacks that result from the same, in some cases, affect the adjacent/surrounding intersections resulting in a poor levels of service at those intersections as well.

The widening of Elizabeth Avenue from Allandale Road west to Freshwater Road and Stamp's Lane and the addition of a new roadway linking Clinch Crescent to Allandale Road were both significant improvements added to the study area road network under the Scenario (S4) Option A. The widening of Elizabeth Avenue to 4 lanes does attract more traffic from the study area network when compared to the volumes on two lane configuration used in Scenario (S3). While the widening does provide some relief in the study area network and some improvement in LOS, it does not provide the relief on Prince Philip Drive as had been expected in the City's Transportation Plan. Please refer to section 3 of the report for more discussion on the widening of Elizabeth Avenue.

The addition of a new roadway linking Clinch Crescent to Allandale Road under the Scenario (S4) Option A does result in a reduction in traffic volumes along the segment of Prince Philip Drive that extends from Westerland Road to Allandale Road and along Allandale Road from Prince Philip Drive to Mt. Scio Road. Section 3.2 of the report discusses this new roadway link in a more detail.

While the changes that were made to the study area road network under Scenario (S4) Option A are significant, and while the level of service improves at many of the intersections within the study area as a result of these changes, there remain many problems that are a result of simply too much traffic on the road network for the capacity that is available.

The capacity of many of the roadways within the study area is limited to a large degree by the number of through lanes present and by the traffic signals that provide right of way control at intersecting roadways. A roadway can typically handle 1,900 passenger cars per lane per hour of green time. When signals are introduced along the roadway, this capacity becomes limited by a number of different factors including the green to cycle length ratio (g/c). For a single lane roadway with normal lane widths, normal grades, no parking interference or bus maneuvers, and no truck traffic, the road capacity would be largely be a function of the $\mathrm{g} / \mathrm{c}$ ratio. With a $\mathrm{g} / \mathrm{c}$ ratio of 0.6 , the roadway capacity available could be reduced to 1,140 passenger cars per hour.

Roundabouts are able to process the traffic at intersections with less delay to motorists than they would experience under a traditional traffic signal control. The study team has added an additional scenario into the analysis, Scenario (S4) Option B, which incorporates roundabout control at many of the study area intersections. The intent was that the roundabout control would reduce delay and improve the LOS throughout the study area.

### 2.3.6.2 Option B - Additional Roadway and Roundabouts

For Scenario (S4) Option B the traffic volumes were again forecasted by the VISUM models and analysed using a combination of Synchro/SimTraffic and the ARCADY/Junctions 8 software to determine the level of service for the signalized and unsignalized intersections and roundabout locations throughout the study area.

## Improvements to the Study Network

The improvements that were added to the road network in Scenario (S4) Option B, primarily include new roundabouts at many of the intersections within the study area. There are 14 locations in total. An additional improvement was required at Morrissey Road and Prince Philip Drive, which was a dual left turning lane in the southbound direction. It should also be noted that Elizabeth Avenue in this scenario remains as a two lane roadway. Also, this scenario did not analyse the following roundabouts, shown in Figure 13, roundabout B, E or G.

Location of Roundabouts added to the study area:

- Allandale Road @ Mt. Scio Road
- Allandale Road @ Higgins Line
- Allandale Road @ Confederation

Building Lot

- Allandale Road @ Prince Philip Drive
- Prince Philip Drive @ New Campus Road
- Allandale Road/Bonaventure Avenue @ Elizabeth Avenue
- Westerland Road @ Elizabeth Avenue
- Clinch Crescent/Westerland Road @ Prince Philip Drive
- Clinch Crescent @ Prince Philip Drive
- Clinch Crescent @ Arctic Avenue
- Clinch Crescent @ New Connection
- Mt. Scio Road @ New Connection
- Thorburn Road @ Prince Philip Drive/Columbus Drive
- Freshwater Road @ Elizabeth Avenue

Concept plans for each of the suggested roundabout locations have been included in Appendix C.

## Discussion of the Results

The LOS results for Scenario (S4) Option B were obtained using both the Synchro/SimTraffic and ARCADY software. The results of the analysis completed for Scenario (S4) Option B are considerably better than the results of any of the previous options analyzed. The introduction of the 14 roundabouts at various locations throughout the study area, reduces the delay and restores the LOS at the majority of the larger intersections to more acceptable levels. There remain a few intersections with movements operating at LOS E and F. These are noted below.

## Thorburn Road \& Columbus Drive/Prince Philip Drive

This intersection was modelled as a multi-lane roundabout with two and three lane approaches. The traffic volumes at this intersection are extremely high with volumes greater than 1,000 vehicles at all approaches. Even with three lane approaches, the LOS for this intersection remains poor. Further investigation and design work is required for this intersection, to determine the best solution.

## Anderson Avenue/Elizabeth Avenue \& Paton Street/Elizabeth Avenue

Both Anderson Avenue and Paton Street are stop-controlled intersections along Elizabeth Avenue. Both roadways have a single lane stop controlled approach to Elizabeth Avenue that accommodates both the left and right turning movements in one shared lane. All turning movements have a LOS F. If a raised median is placed in Elizabeth Avenue to eliminate the left turning movements, the LOS will improve at both intersections. The planned roundabouts on Elizabeth Avenue will facilitate the left turning movements.

## Freshwater Road \& Stamps Lane/Oxen Pond Road

This intersection has both commercial buildings and/or homes on all four quadrants which limits the options to improve this intersection. Significant property acquisition would be needed to facilitate improvements to this intersection to achieve acceptable levels of service. Further investigation is required at this intersection to determine the best solution.

### 2.3.7 Estimated Costs - High Level Analysis

Harbourside Transportation Consultants has provided Class 5 cost estimates for the projects that had been envisioned under the high level analysis for this study. These estimates do not reflect costs of any land acquisition that may be required to facilitate the same. A priority plan for the high level analysis improvements was not established by HTC. It was assumed this would be provided when the work associated City's Transportation Plan update gets underway in near future.

Figure 13: Roundabout \& Roadway Modifications

The total estimated cost of the improvements that have been suggested by HTC under the high level analysis work completed for this project is $\$ 21.7$ million dollars and is shown below in Table 11. Again this cost does not reflect land acquisition nor does it reflect the cost of the storm sewer upgrading that will be required along the Elizabeth Avenue corridor which will be significant in of itself.

Table 11: High Level Analysis Cost

| Road Network Modifications |  |  |  |
| :---: | :---: | :---: | :---: |
| New Roadways |  |  |  |
|  | New Clinch Crescent Connector | \$ | 3,000,000 |
|  | Prince Philip Drive \& Elizabeth Avenue Corridor (New Road - Roundabout B to Roundabout E) | \$ | 1,000,000 |
|  | Total New Roadway Cost | \$ | 4,000,000 |
| Road Network Improvements |  |  |  |
| 1 | Freshwater Road/Elizabeth Avenue to Elizabeth Avenue/New Road | \$ | 600,000 |
| 2 | Elizabeth Avenue/New Road to Elizabeth Avenue/Allandale Road/Bonaventure Avenue | \$ | 1,000,000 |
| 3 | Prince Philip Drive/Clinch Crescent (West) to Prince Philip Drive/New Road | \$ | 500,000 |
| 4 | Prince Philip Drive/New Road to Prince Philip Drive \& Clinch Crescent (East) | \$ | 300,000 |
| 5 | Prince Philip Drive \& Clinch Crescent (East) to Prince Philip Drive \& New Campus Road | \$ | 500,000 |
| 6 | Prince Philip Drive \& New Campus Road to Prince Philip Drive \& Allandale Road | \$ | 600,000 |
| 7 | Clinch Crescent \& Arctic Avenue to Clinch Crescent \& New Clinch Crescent Connector | \$ | 300,000 |
|  | Campus Road | \$ | 250,000 |
|  | Total Road Network Improvements Cost | \$ | 4,050,000 |
| Roundabouts |  |  |  |
| A | Freshwater Road \& Elizabeth Avenue | \$ | 750,000 |
| B | Elizabeth Avenue \& New Road | \$ | 600,000 |
| C | Elizabeth Avenue \& Allandale Road/Bonaventure Avenue | \$ | 1,000,000 |
| D | Prince Philip Drive \& Clinch Crescent (West) | \$ | 900,000 |
| E | Prince Philip Drive \& New Road | \$ | 900,000 |
| F | Prince Philip Drive \& Clinch Crescent (East) ${ }^{1}$ | \$ | 900,000 |
| G | Prince Philip Drive \& New Campus Road | \$ | 1,100,000 |
| H | Prince Philip Drive \& Allandale Road ${ }^{1}$ | \$ | 1,500,000 |
| 1 | Clinch Crescent \& Arctic Avenue | \$ | 750,000 |
| J | Clinch Crescent \& New Clinch Crescent Connector | \$ | 750,000 |
| K | Allandale Road \& Mt. Scio Road | \$ | 1,200,000 |
| L | Allandale Road \& Confederation Building Entrance | \$ | 750,000 |
| M | Allandale Road \& Higgins Line | \$ | 750,000 |
| N | Prince Philip Drive/Columbus Drive \& Thorburn Road ${ }^{1}$ | \$ | 1,800,000 |
|  | Total Roundabout Cost | \$ | 13,650,000 |
|  | al Cost for High Level Analysis | \$ 21,700,000 |  |

${ }^{1}$ Please note that the configurations for Roundabouts F, H \& N are different between the detailed analysis and high-level analysis. As a result, the costs between Table A and Table B for these roundabouts are different.

### 2.3.8 Findings and Recommendations - High Level Analysis

Modelling Scenarios for the High level traffic analysis, use VISUM model output volumes on the study area road network under existing intersection timing/phasing and lane configurations in both the AM and PM peak periods of day.

The new roadway connecting the intersection of Mt. Scio Road and Allandale Road to Clinch Crescent is expected to draw an average daily traffic volume of $18,500 \mathrm{vpd}$. This new roadway in combination with the additional lanes on Elizabeth Avenue reduce the overall traffic volumes on segments of Prince Philip Drive and Allandale Road, but the relief, while significant and needed, is not sufficient enough itself to re-establish acceptable levels of service at the vast majority of intersections throughout the study area. This connection should be considered as a long term improvement and a right-of-way should be reserved of 35 m .

Scenario (S4) Option B is the roundabouts scenario for the study area. The study team replaced the traffic signals at 14 intersections throughout the study area with roundabout control and in doing so were able to re-establish acceptable levels of service at the vast majority of the study area intersections without the need to widen any existing streets in the study including Elizabeth Avenue.

Summaries of the overall intersection LOS results from both Synchro/SimTraffic and ARCADY for both the AM and PM peak hour analysis periods for Scenarios S1, S2, S3, S4, Option A and S4, Option B are shown in Table 12 and Table 13 that follow. All concept drawings can be found in Appendix C.

Table 12: All Scenarios - AM Peak Hour ARCADY \& Synchro Analysis Results

|  | AM Peak Hour - S1 |  |  |  | AM Peak Hour - S2 |  |  |  | AM Peak Hour - S3 |  |  |  | AM Peak Hour - S4-A |  |  |  | AM Peak Hour - S4-B |  |  |  |

## 3 Long Term Network Improvements

### 3.1 Widening of Elizabeth Avenue

The 1998 St. John's Transportation Study (SGE) served to analyze the road network in St. John's and determine its shortcomings, both today and in the future. There were various problems identified, including Problem 4: Congestion on Inner Ring Road due to Growth in External Travel Demand. The "Inner Ring Road" was defined as the collection of Columbus Drive and Prince Philip Road. The study demonstrated that congestion would continue to build in this area if nothing was done. The study identified three potential solutions to relieve congestion on the Inner Ring Road:

- Widen Elizabeth Avenue (from Bonaventure Avenue to Freshwater Road)
- Improve interchange Realignment at Kenmount Road
- Widen Empire Avenue

The concept of widening Elizabeth Avenue suggested the road be widened to four lanes, plus turning lanes. It also suggested that the intersection of Elizabeth and Freshwater be modified to allow free flow from Freshwater to Elizabeth. The main purpose of this recommendation would be to divert University/Confederation Building traffic away from Prince Philip Drive. The study also noted that this increase in capacity on Elizabeth Avenue will result in a certain level of neighbourhood shortcutting through the adjacent residential streets. Traffic calming measures were suggested to mitigate this potential issue. In 2006, Kendall Engineering Limited was retained to assess the options that were available to widen Elizabeth Avenue, with cost estimate and phasing plans. One of this study's objective is to reaffirm whether or not the project is still required from a technical perspective.

### 3.1.1 Existing Conditions

Elizabeth Avenue is a currently operating as a two (2) lane cross section that parallels Prince Philip Drive with a posted speed limit of $50 \mathrm{~km} / \mathrm{hr}$. There are multiple side streets and driveways that have access onto Elizabeth Avenue. Today, there are unsignalized side streets, such as Paton Street and Anderson Avenue, which have difficulty finding a gap to enter onto Elizabeth Avenue, either making a left or right turn. Due to the high volumes on the main street, there are very few gaps to allow other vehicles to enter onto Elizabeth Avenue during the peak hour periods.

The Elizabeth Avenue corridor is also a heavily travelled pedestrian area for the University. The region to the south of Elizabeth Avenue is a popular housing area for students and has parking lots for students and staff of MUN. Any improvement plan for Elizabeth Avenue must accommodate this mode of travel.

### 3.1.2 Future LOS

Level of Service (LOS) results in the 1998 study show that the existing conditions of the intersections of Elizabeth/Westerland and Elizabeth/Bonaventure operate at failing level of service (F). The analysis completed for Scenario 0 - Existing Conditions 2014, show both of the intersections operating with an overall LOS D or better in both the AM and PM peak hours.

To mitigate this, the recommended improvement option included widening the corridor to four lanes and the necessary turning lanes at the intersections. While this improvement was seen as a necessary measure to accommodate traffic growth in the area, the widening would result in a significant change to the network and the landscape in the area. Wider streets and the addition of auxiliary turning lanes would reduce the amount of green space in the area and the accommodation of additional traffic volumes would create more difficulty for local residents accessing their driveways from Elizabeth Avenue.

### 3.1.3 Technical Justification

Elizabeth Avenue is a critical connection and access route for student, faculty and staff at MUN. It serves as an access area for vehicles, pedestrians and cyclists. There is a need to continue and improve upon this access to the south side of campus, but to be sensitive to local residents and side street accesses. The ultimate solution can provide additional vehicle capacity at the intersections while providing an environment which promotes lower speeds, pedestrian safety and side street/driveway access.

The public feedback indicated that there was not a desire to create another high speed, high capacity facility like Prince Philip Drive. There is, however, a need to create additional vehicle capacity to share the traffic load with Prince Philip Drive. Without it, Prince Philip Drive traffic will continue to grow to levels that will exceed the capacity of the intersections.

Resurfacing of Elizabeth Avenue is required in the short term regardless of other improvements. Although, it is not within the next 10 years, the underground infrastructure on Elizabeth Avenue has also been identified for an upgrade.

### 3.1.4 Required Features

Elizabeth Avenue needs to serve a number of functions, including providing alternate access to the MUN campus, providing access to the local residential community and creating a safe, efficient route for pedestrians and cyclists. The intersections must operate safely and efficiently and the roadway should not create an environment which results in high vehicle speeds. Being on the edge of the campus, the road design should ideally create an atmosphere which has the feel of a university campus, but includes all of the required facilities to accommodate the various users. Roadway lighting should be included, along with clear way finding signage. If properly designed, this stretch of roadway can become a true asset in the roadway network within the study area. Long Term Network Improvements

### 3.1.5 Long Term Concept Plan

An alternative concept was developed in order to increase the capacity of the street and its intersections, while also minimizing improvement capital costs and disturbance to the local neighbourhoods. This concept included the introduction of a roundabout corridor, complete with a non-traversable median.

This concept is worth considering because it provides the ability for the corridor to accommodate greater levels of traffic without the need to widen the street. The reason for this is that the roundabout intersections can handle higher traffic volumes through "flaring", or the creation of additional lanes at the intersection without the need for multiple through lanes or auxiliary turning lanes. Also, the roundabout intersections, as numerous studies show, result in a higher level of intersection safety over more traditional signalized or stop-controlled intersections. With the inclusion of a raised, non-traversable median along the entire corridor, left turning movements into driveways and streets will be eliminated in favour of safer right turn movements. Vehicles will simply make a U-turn at the roundabout intersections in order to access driveways. Finally, the ability to introduce roundabouts, medians and a narrower corridor will enable the City to create a greener, more aesthetically-pleasing streetscape which can easily accommodate all users vehicles, pedestrians, cyclists and others.

Sketches SSK-12 to SSK-14 illustrate the proposed changes to Elizabeth, between Freshwater and Bonaventure, including a typical road cross-section concept for Elizabeth Avenue which can be found in Appendix C. This cross-section should be refined at the time of project implementation.

Traffic Calming may be required for Whiteway Street with the addition of a roundabout at the intersection of Elizabeth Avenue and Whiteway Street. A proactive traffic calming assessment of Whiteway Street should be conducted at the time that a modified intersection is considered, in accordance with the City of St. John's Traffic Calming Policy.

Consideration needs to be given to the crosswalks and access points at Westerland Road, Newtown Road, Parking Lot 15B entry and Russell Road, as part of this upgrade project.

The redesigned Elizabeth Avenue also needs to consider how transit stops will be treated. This includes a possible minor transit station near the Arts and Administration Building.

### 3.2 Proposed Roadway connection - Allandale Road to Clinch Crescent

The proposed road network connection from the Mt. Scio Road intersection with Allandale Road to Clinch Crescent has been an on and off again topic of discussion for as far back as when the original planning was completed for the Outer Ring Road; and while this Pippy Park Link may have generated some discussion at various times it has never formed part of the original planning package for the construction of the Outer Ring Road.

Figure 14: Proposed Roadway Connection - Allandale Road to Clinch Crescent (Pippy Park Link)

More recently, in 2007, this roadway was reviewed as part of a MUN student Engineering project, the conclusions of which indicated that better access to the Health Sciences Complex could be achieved with the construction of a 4 lane roadway linking the Mt. Scio Road intersection with Allandale Road with Clinch Crescent. It was also noted that such a link would help to alleviate some of the traffic congestion experienced along Allandale Road at different peak periods of the day.

As part of this project, HTC was tasked to look at this roadway linkage again, and to determine first of all, whether or not the roadway is needed as a long term network improvement in the MUN study area and if so, to what standard it should be built.

The new roadway connecting the intersection of Mt. Scio Road and Allandale Road and Clinch Crescent is expected to draw an average daily traffic volume of 18,500 vpd. The PM peak hour volumes are the heaviest, with $1,450 \mathrm{vph}$ in the NB direction and some 925 vph in the SB direction. HTC completed a comparison between Scenario 3 and 4B to determine the amount of traffic that would be reduced on Prince Philip Drive. Approximately a total of 650 vehicles would be reduced off of Prince Philip Drive.

### 3.2.1 Conclusion <br> Is the proposed roadway from the intersection of Mt. Scio Road and Allandale Road to Clinch Crescent needed?

The comparison of the VISUM analysis completed by HTC for Scenarios 3 and 4A indicate that the proposed roadway from the intersection of Mt. Scio Road and Allandale Road to Clinch Crescent will handle fairly significant volumes during both the AM and PM peak hour periods. The proposed route is attractive for motorists in the study area and will help reduce the traffic volumes on Prince Philip Drive and Allandale Road to more manageable levels. The roadway does provide a much more direct route from the Outer Ring Road to the University and the Health Sciences Complex; both of which are major traffic generators. It also provides an alternative means of access to Health Sciences complex that is not reliant on Prince Philip Drive. This roadway could be used as a construction detour for any upgrading required for Prince Philip Drive.

Short term recommendations alleviate expected traffic concerns along Prince Philip Drive to 2025. However, this link provides significant new capacity into the area. The roadway should be built to a twolane RCU 80 standard, which includes a 3.5 m travel lane, 0.5 m paved shoulder, 1 m gravel shoulder and 1 m rounding, as per the City of St. John's standards. This cross section was used in the cost estimates provided. Roundabouts were used as the method of traffic control at the new intersections and were also included in the cost estimates. Flaring to two lanes may be required on the entrance to the roundabouts. A 35 m right-of-way should be reserved to allow for future needs.

## 4 Operational Network Improvements

### 4.1 Prince Philip Drive/Morrissey Road/Irwin's Road and Livyer's Loop

The Prince Philip Drive intersection with Morrissey Road has been a source of complaints for both pedestrians and motorists for many years. The geometric alignment and configuration of this intersection is not typical in terms of what motorists expect from a four way signalized intersection. The Prince Philip Drive approaches are two lanes in both the east and west directions with an auxiliary left and right turning lane on the westbound approach only. Eastbound traffic on Prince Philip Drive is not permitted to turn either left onto Morrissey Road or right onto Irwin's Road. The posted speed limit on both of these approaches is $70 \mathrm{~km} / \mathrm{hr}$. The Morrissey Road approach to the intersection has two lanes exiting and two lane entering and a raised concrete median island. The Livyer's Loop approach consists of a single lane shared left thru right lane and one receiving lane. The Livyer's Loop approach is set back from the other approaches of the signalized intersection by Irwin's Road which runs parallel to Prince Philip Drive. The Irwin's Road approach to Livyer's Loop is stop controlled. The configuration of the intersection is noted below in Figure 15.

Figure 15: Intersection of Morrissey Road and Prince Philip Drive

The lane alignments for both Morrissey Road and Livyer's Loop are not ideal. They are somewhat staggered and this combined with the fact that the intersection is narrow for the north and southbound directions leads to conflicts in the turn paths of opposing vehicles. Motorists exiting Livyer's Loop can also be confused by the presence of Irwin's Road causing them to turn left prematurely into the opposing lanes on Prince Philip Drive.

The configuration of Irwin's Road and the east intersection with Livyer's Loop and Prince Philip Drive is also somewhat complicated and confusing for motorists. Traffic exiting Irwin's Road onto Prince Philip Drive and traffic exiting Livyer's Loop onto Prince Philip Drive may have some difficulties with right of way issues. The intersection does not meet the normal standards for intersection spacing.

Figure 16: East Intersection of Livyer's Loop/Irwin's Road and Prince Philip Drive

The configuration of Livyer's Loop and its connection to Morrissey Drive, Phelan Road, Burton's Pond Road and Russell Road has in the past lent itself to some shortcutting of traffic through campus coming from Elizabeth Avenue travelling to Artic Avenue and Clinch Crescent and the Health Sciences Complex.

This shortcutting of traffic, combined with the construction activities associated with the new residence buildings, lead the University to prohibit traffic from proceeding north on Livyer's Loop beyond the access to the Science Building parking lot access. The concern with the short cutting traffic, is the speeds they
travel at and potential for conflicts with the high volumes of pedestrian traffic that cross Livyer's Loop and Phelan's Road on a daily basis.

To resolve these problems, HTC is suggesting a reconfiguration of the road network in this area. The reconfiguration involves closing the Morrissey Road intersection with Prince Philip Drive. The segment of Morrissey Road between Artic Avenue and Prince Philip Drive would be removed and the medians on Prince Philip Drive closed and fenced accordingly to prevent pedestrian movements across Prince Philip Drive at this location. Traffic on Arctic Avenue would be re-routed left onto Morrissey Road and eventually to a new roadway extending from Morrissey Road to the east intersection of Livyer's Loop with Prince Philip Drive. A roundabout would be installed at this intersection. The Livyer's Loop approach to the roundabout would be restricted to a right turn by-bass lane. This of course would be optional and is being suggested for the sole purpose of controlling the amount of short cutting traffic moving from Elizabeth Avenue to Artic Avenue and point's west on campus. The segment of Irwin's Road along the frontage of the Main Dining Hall would be turned into a limited access cul-de-sac; used mainly for deliveries, etc.

Under such a scenario, the segment of Morrissey Road from Prince Philip Drive to Artic Avenue would be closed. The median on Prince Philip Drive and the opening for Irwin's Road on Prince Philip Drive would also be closed and the traffic signals controlling this intersection would be decommissioned. The concept plan of the proposed road network re-configuration is shown below in Figure 17.

Figure 17: Proposed Road Network Reconfiguration - Morrissey Road and Livyer's Loop.

The existing pedestrian tunnel near St. John's College has recently been upgraded to provide a usable grade separated link in this area of campus. A new multi-use underpass on the Morrissey to Livyer's alignment should be investigated as part of this closure of this intersection. This underpass may also be able to serve smaller maintenance vehicles. The one way restriction on the segment of Livyer's Loop from Irwin's Road to the access to the parking lot for the Science Building should remain in place as a permanent feature.

Consideration should also be given to extending Phalen's Road to intersect the Rodney Street/Elizabeth Avenue intersection. This will result in the need to remove 208 Elizabeth Avenue, but it will also eliminate several vehicle movements that are essentially forced now to travel through parking lots and the associated pedestrian traffic.

### 4.2 Westerland Road/Pedestrian Concerns

One of the more predominant and reoccurring themes that has come up during the public consultation process (the interactive website) and through the stakeholder consultation process, is the pedestrian safety issue on Westerland Road. Westerland Road is the only direct connection between Elizabeth Avenue and Prince Phillip Drive that exists west of Allandale Road, and the only such connection which runs through the MUN campus. Due to the nature of its connectivity, Westerland Road is subject to relatively heavy traffic volumes as an alternate path to and from the MUN campus and the Health Sciences Center. The Westerland Road/Prince Phillip intersection is aligned opposite the Prince Phillip/Clinch Crescent to create a four-legged intersection. Clinch Crescent is the one of the main access points into MUN, close to the new parking facility, and a primary access into the Health Sciences Centre. Access points directly on Westerland Road serve as entries into the center of campus and into MUN parking facilities. Also located on Westerland Road is the MUN Aquarena and the CBC Building. All of these factors create a section of road which is busy, and can be subject to higher than desired vehicular speeds.

Figure 18: Westerland Road
Besides the vehicular traffic on Westerland Road, it is the site of a large volume of pedestrian traffic, including the two of the busiest pedestrian crossings within the study area. This is primarily due to the fact that there is exists a large parking lot immediately west of Westerland Road. During the morning, and at most times of the day, pedestrians are crossing Westerland Road, going to and from their vehicles. The MUN Campus Master Plan also indicates that a future parking structure could be built on the west side of Westerland Road to increase available parking on campus. In addition to the parking, there exists a
significant portion of the student population who live to the west of campus and require crossing Westerland Road to get home, either by foot or bicycle.

There has been a long-standing concern with the conflicts introduced between the heavy vehicle traffic and the heavy pedestrian traffic. This has created a number of accidents and near-misses through the years. The University has undertaken a pedestrian crossing study in the recent past and one of the sets of recommendations included a set of improvements intended to improve pedestrian safety on Westerland Road. These recommendations included high visibility flashing beacons to increase crosswalk visibility and roadside bulb-outs intended to reduce vehicle speeds and to minimize crossing distances. These improvement measures have recently been installed and the University, by all accounts, is pleased with the resulting road section. The improvements are getting favourable feedback and reaction from the students, faculty and other users.

While these improvements are appearing to have a positive impact, there is concern that the positive impacts may be a function of drivers reacting to a change in conditions and that the driver behaviour may migrate towards its previous conditions (high volumes, high speeds) after drivers become familiar with the new conditions. It is recommended that the crossings be monitored over time to ensure the new beacon system remains effective.

In the long term, and in keeping with the goals of the Campus Master Plan (Brook Mcllroy), it would be recommended to completely remove a majority of this vehicle/pedestrian conflict. There does exist the possibility to relocate Westerland Road to the west, effectively removing the road from the interior of campus and building it on the periphery of the campus, to the west of any on-campus parking. There exists a significant amount of space on the west side of the existing parking, enough to accommodate a new, single lane, two-way roadway. This realigned Westerland Road would serve to provide nearly the same level of connectivity for vehicular traffic, with the exception that it would not align directly with Clinch Crescent. The driver would have to travel through an additional intersection to access Clinch Crescent.

The existing Westerland Road would be closed completely to through traffic and may only be used for local access, if necessary. Alternatively, Westerland Road could become a transit only corridor. This would create a pedestrian-friendly corridor within the confines of the now-abandoned roadway. Access to the existing parking lots would now come through the new road from the west and keep vehicle access to campus on the periphery. While there would still be some pedestrian crossings required, the crossings would be limited to pedestrians who walk to campus from an off-site location. Through proper design, it should be the goal to direct pedestrians to cross at the new intersections that would be created at Elizabeth Avenue and Prince Phillip Drive. The road's primary function would be to move vehicles and to gain access to the parking areas on the west end of campus. Additional access would be created from the new Westerland Road to connect to Irwin's Road. Also, the new road would be connected to the existing University Avenue, likely with a right-in/right-out intersection. The existing intersection of University Avenue and Prince Phillip Drive would be replaced by the intersection of new Westerland Road and Prince Phillip. The proposed layout is illustrated in Figure 19 below and on drawing sketch SSK-14 in Appendix C.

Figure 19: Westerland Road Re-Alignment Concept Plan

## 5 Public Transit

### 5.1 Public Transit Operational Review

### 5.1.1 Background

St. John's Transit Commission (Metrobus) provides transit service to the City of St. John's with a population of 130500 and contracted transit service to the City of Mount Pearl with a population of 25,000.

Metrobus operates 23 bus routes using 53 forty-foot diesel buses and employs 124 full-time and 20 parttime staff. Service is provided seven days a week operating from 6:00 am until 12:30 am weekdays, 7:30 am until 12:30 am Saturdays and 8:30 am until 10:30 pm on Sundays and Holidays.

Increasing transit ridership has been an on-going challenge for Metrobus. This was compounded by a three month long strike by unionized transit workers in 2010/11. Ridership for the last three years was 2.52 million in 2011, 3.07 million in 2012 and 3.01 million in 2013.

In 2011, Metrobus contracted Dillon Consulting to conduct a "Market Assessment and Strategic Directions Study" including a comprehensive review of its operations. Since the completion of this study, Metrobus has introduced a number of recommended improvements including extended hours of service, new transit routes, improvements to service frequency, introduction of Google Transit Trip planning and a significant investment in the bus fleet replacing older buses with accessible low floor vehicles.

In May, 2014, Metrobus moved into new state-of-the art transit facilities located at 25 Messenger Drive, St. John's. The new facilities will allow for future expansion of transit service.

Metrobus has retained consulting services to complete a detailed study of a Universal Pass (UPass) program for Memorial University students. This study was conducted during the MUN Traffic Study and included surveys of student travel patterns, student attitudes regarding existing transit service and a review of existing transit routes and services and recommendations for service levels and routing to meet students' needs.

### 5.1.2 Marketing and Promotional Advertising

Metrobus has been recognized for excellence in marketing receiving a number of national awards including three awards related to the implementation of the Air Miles loyalty program in 2012. These awards include two awards at the Air Miles Excellence Awards - one in the Community and Sustainability category and one in the New Sponsor Launch category, and an award for the development and implementation of marketing and communications initiatives by the Canadian Urban Transit Association in 2013.

Metrobus provides a number of customer conveniences to assist with their transit travel including Google Transit Trip Planner, interactive route map, text alerts on bus arrivals, printed route maps and schedules, electronic fare payment and the Air Miles loyalty program.

### 5.1.3 Google Transit Trip Planner

Google Transit Trip Planner is used by transit systems worldwide. Metrobus customers can go to the Metrobus website and log onto "plan a trip" and enter the departure location, destination and departure or arrival time. The system will show the bus routes available to make the trip and the length of time the trip will take and display the routing options on a map. This system makes planning transit travel easy and convenient.

### 5.1.4 Text Alerts

Interactive texting allows Metrobus customers to sign-up and receive service notices, view information regarding the balance and expiry on their M-Card and search bus route and schedule information.

### 5.1.5 Air Miles

Starting in May 2012, Metrobus was the first transit system in the world to join the Air Miles rewards program. Metrobus customers can earn Air Miles by registering for their M-Card and earn Air Miles reward miles when loading their card. This program is an added-value initiative that promotes the M-Card fare payment and rewards customers with Air Miles for using public transit.

### 5.1.6 Printed Bus Routes and Schedule Information

With many bus routes and time schedules, making transit information readily available and easy to understand especially for visitors and new or occasional users, requires providing the information in many formats. Metrobus has excellent transit information on their website.

Metrobus also provides printed schedules for each individual transit route including a map of the route. These schedules are available on all transit buses and at M-Card sales outlets.

Metrobus printed schedules and maps show the routing for the single bus route making planning transit trips difficult as they don't show multiple routes available to the same destination or connections to other transit routes. In addition, the route maps and street served are difficult to read.

## Recommendations Operational Review:

- Metrobus to develop a comprehensive printed route map and schedule booklet showing all bus routes and scheduling information such as major transfer points, terminals and major destinations as well as bicycle routes and walking paths connecting to transit service.
- Metrobus to install printed route map and schedule displays at major transit destinations, transit terminals and bus shelters and in the Health Sciences Center, Memorial University and the Confederation Building.
- Metrobus to investigate the installation of interactive electronic screen displays in major transit points, malls and transit terminals displaying transit route and real-time transit information and transit trip planning capability.
- Metrobus to develop a transit information booklet for inclusion the university student orientation package.

### 5.2 Fare Strategies

### 5.2.1 M-Card

M-Card is an interactive smart card fare payment system. Customers can register for an M-Card and add rides or thirty (30) day passes. Customers can load and reload M-Cards on-line or at Metrobus sales outlets. M-Cards can be loaded using credit or debit cards.

M-Cards loaded on-line are uploaded by an on-board validator on the bus. When loading an M-Card online, there is a delay of up to 24 to 48 hours for the transaction to be completed and updated on the bus fleet. This requires customers to load the cards well in advance of using the M-Card or reloading the card before the remaining rides on the card are exhausted. In 2013, sixty-four (64) percent of rides were paid using M-Cards.

### 5.2.2 U-Pass Program

A U-Pass program for full-time university students increases ridership and allows the transit agency to improve service not only to the university but the transit network as a whole. Metrobus is in the process of studying a U-Pass program with Memorial University. Currently, Memorial University students can purchase semester passes at $\$ 245$ per semester. A more detailed discussion of the U-Pass program is included in Appendix E.

### 5.2.3 EcoPass Program

Partnering with major employers to provide employer-provided bus passes (often referred to as an "EcoPass" program) can increase transit use by commuters. Bus passes can be provided through payroll deductions and can be subsidized by the employer or the transit agency.

### 5.2.4 Transfer Policy

In January, 2014, following a recommendation in the "Metrobus Market Assessment and Strategic Directions Study" prepared by Dillon Consulting, Metrobus initiated a "timed transfer policy" whereby a bus transfer is valid for a specific period of time on any transit route, making the transfer a short term bus pass. Timed transfers reduce conflicts between bus drivers and passengers regarding the validity of transfers, allows passengers wishing to make short trips the opportunity to return on the same fare if they are returning within the allotted time of the transfer and allows passengers to make quick stops along their travel and not have to pay an additional fare to continue their trip. Metrobus transfers were valid for 120 minutes from the time of issue. Due to driver concerns regarding abuse and passing of valid transfers between people, the policy was reverted back to the previous policy where transfers are only valid on connecting buses travelling in a continuous trip.

## Recommendations - Fare Strategies:

- M-Card has become the method of choice for most Metrobus customers. Effort should be made to reduce the time lag in loading and uploading of rides and passes on M-Cards and expand sales outlets.
- Metrobus to complete the study of a U-Pass program for Memorial University students and consider expansion of the program to other educational institutions (refer to Appendix E).
- Metrobus to investigate the implementation of an employer-provided bus pass program with major employers, including the faculty and staff at Memorial University, the Health Sciences Center and the Provincial Departments located in the Confederation Building and the City of St. John's. The combination of a U-Pass program for Memorial University students and an EcoPass program for employees at the university, Health Sciences Center and Confederation Building would significantly increase ridership and fund service improvements on transit routes serving these institutions.
- Metrobus to revisit the timed transfer policy. Many transit systems have adopted a timed transfer policy. Research should be carried out on other transit systems regarding policies to reduce abuse of the policy. It is recommended to reduce the time allowed for a valid transfer from 120 minutes to 90 minutes after the last time point on a route.

### 5.3 Transit Planning

### 5.3.1 Regional Transit

The "Metrobus Market Assessment and Strategic Directions Study" prepared by Dillon Consulting Ltd., and adopted by St. John's Transit Commission, recommended the commission work with surrounding municipalities to establish a regional transit system.

Transportation issues as a result of growth in the surrounding rural and suburban areas can best be addressed by a regional approach. Metrobus has recently invested in new transit facilities and has the infrastructure to provide for future growth in transit service to the surrounding areas including the City of Mount Pearl, Conception Bay South and Paradise.

### 5.3.2 Transit Oriented Design

Through "smart growth" initiatives like transit-oriented development and design, ensuring transitsupportive land uses and locating high density residential and employment densities near transit, creating convenient pedestrian and cycling connections, managing parking and creating attractive and functional transit terminals, the City will realize significant returns on its' transit investment.

Transit Oriented Design (TOD) places public transit at the centre of a community by providing high quality transit service within walking and cycling distance from high density development. This type of transitfriendly design can support local or community transit service with connections to main bus routes for travel to other areas.

### 5.3.3 Transit Priority Measures

Metrobus staff, in consultation with bus operators and supervisors, reviewed twenty-six (26) intersections in the City of St. John's and have identified a number of intersections where transit priority signals would improve transit travel times and on-time performance, particularly along the Prince Phillip Drive corridor. These include:

- Topsail Road @ Hamlyn
- Topsail Road @ Columbus Drive
- LeMerchant Road/Harvey Road @ Longs Hill
- LeMerchant Road @ Cookstown Road
- Columbus Drive @ Captain Whelan Drive
- Prince Phillip Drive @ Portugal Cove Road
- Prince Phillip Drive @ Clinch Crescent/Westland Road
- Prince Phillip Drive @ Thorburn Road
- Freshwater Road @ Thorburn Road
- Freshwater Road @ Crosbie Road

### 5.3.4 Transit Terminals

Transit terminals, particularly at the Artic Avenue entrance to Memorial University and the Avalon Mall, require improvements to bus accesses, passenger waiting areas and public amenities. The Artic Avenue terminal has many as five (5) buses in the terminal at one time. This, combined with automobile traffic and parking, makes the area over-crowed and unsuitable for expansion of service to the University. In the longer term, a suitable location for a new terminal serving both the Memorial University and the Health Sciences Center should be considered. Transit priority signals at the intersection of Clinch Crescent and Prince Phillip Drive and Morrissey Road and Prince Phillip Drive would assist transit vehicles entering and exiting the area. The Avalon Mall is a major transit terminal with a number of transit routes servicing the mall and a transfer point for passengers transferring between routes. A number of these routes serve the study area. This terminal requires upgrading with adequate bus access and passenger amenities.

Possible new transit station location, include, but are not limited to; Arctic Avenue, Prince Philip Drive, Irwin's Road, Pedagogue's Close or Westerland Road.

### 5.3.5 Transit Shelters

Transit shelters offer bus passengers shelter from inclement weather and include amenities that make waiting for the bus safer and more comfortable. Bus shelters should be installed where there is high transit use or near facilities such as seniors residences and schools. Amenities can include benches, lighting, heating, transit route and schedule information, newspaper boxes, recycling receptacles and be fully accessible. Metrobus currently has sixty-nine (69) bus shelters. Given the number of bus stops in the service area, Metrobus should consider doubling the number of bus shelters throughout the service area.

Public Transit

### 5.3.6 Park and Ride

Park and Ride facilities located at the periphery of the metropolitan area can extend the availability of transit well beyond the service area. Park and ride sites can range from gravelled lots to major facilities with paved parking and indoor waiting areas. Underutilized parking space at malls can benefit both the mall businesses and transit by designating spaces for park and ride customers. Providing parking and frequent, direct, limited stop transit to major destinations can reduce the number of automobiles travelling into congested areas. Currently, Metrobus has no park and ride sites available during off-peak hours, these sites could be served by regular transit routes.

Examples of possible park and ride locations with service to the study area to consider are:

1. A park and ride location in the vicinity of Airport Heights and Portugal Cove Road with peak express service following the Route 24 along Portugal Cove Road, Higgins Line, Allandale to Prince Phillip Drive serving Prince Phillip Drive with stops at the Health Sciences Centre and Memorial University.
2. A park-and-ride location in the area of the O'Leary Industrial Park near Pippy Place and Kenmount Road with peak express service following Kenmount Road to Prince Phillip Drive and serving Memorial University and the Confederation building. A park-and-ride site at this location would serve commuters from the Conception Bay South area as well as local residents. This service could be interlined with express service from the Airport Heights area to create an express route from Airport Heights to the O'Leary Industrial Park area providing express service to the Health Sciences Center, Memorial University and the Confederation Building in both directions.
3. A park-and-ride location in the area of Topsail Road and Commonwealth Drive with peak express service along Topsail Road to Blackmarsh Drive to Columbus Drive to Prince Phillip Drive serving Memorial University. This park and ride site would serve commuters from the City of Mount Pearl.
4. A park-and-ride location in the area of Smallwood Drive and Commonwealth Drive with peak express service along Smallwood Drive, Dunn's Road to Topsail to the Village Mall and continuing on Columbus Drive to Prince Phillip Drive to Memorial University.
5. A park-and-ride site located in the area of Kenmount Road and Mount Carson Avenue with peak express service along Kenmount Road to Prince Phillip Drive serving Memorial University. This location would serve commuters from Paradise and surrounding area.
6. Park-and-ride spaces at the Avalon Mall, the Village Mall and the Torbay Mall.

## Recommendations - Transit Planning:

- The St. John's Transit Commission continue to engage the Province and neighbouring municipalities in discussions to develop a regional transit system.
- Metrobus staff work with City planning staff to promote transit-oriented design in future development plans.
- Metrobus staff work with the City of St. John's to install transit priority signals and queue-jump lanes at key intersections.
- Metrobus work with Memorial University to improve the Arctic Avenue terminal.
- Metrobus work with City staff to install transit priority signals along Prince Phillip Drive.

Public Transit

- Metrobus identify a suitable location for a new transit terminal to serve the Health Sciences Center and Memorial University. The corner lot at Clinch Crescent and Prince Phillip Drive should be considered as a possible location.
- Metrobus work with the Avalon Mall to improve transit facilities.
- Metrobus develop a bus shelter program to increase the number of bus shelters including criteria for locating shelters and guidelines to determine the amenities that should be included at each location.
- Metrobus develop a park-and-ride program to identify possible locations for park-and-ride sites and transit service to the study area.

### 5.4 Service Review

A survey of Memorial University students and faculty was conducted in 2010. Surveys of on-board passengers, focus groups, stakeholder meeting and public open houses were carried out as part of the "Metrobus Market Assessment and Strategic Directions Study". A number of issues were identified including the need for improved transit schedules, new routing and improved customer information. Since the completion of the "Metrobus Market Assessment and Strategic Directions Study", Metrobus has introduced a number of service improvements.

### 5.4.1 New Transit Services to Study Area

Metrobus operates a number of transit routes serving Memorial University and the Health Sciences Centre with Routes $1,5,9,10,13,14,15,16,17,20,23,24$ and 26 serving the Artic Avenue entrance to Memorial University with Routes $10,13,15,16,20$ and 23 also serving the Clinch Crescent entrance of the Health Sciences Centre. Routes 2 and 5 serve Memorial University at the Elizabeth Avenue entrance. Routes 1, 9 and 17 serve the Confederation Building.

Recently, Metrobus has increased service to these institutions:
Route 24 - a new express route providing local service to the Airport Road, Airport Heights Drive area with non-stop express service from Rhodora Drive to Memorial University's Artic Avenue entrance. This route operates one (1) morning trip starting at Airport Road and Major's Path at 7:40 am and arriving at Memorial University at 8:00 am.

Route 26 - A new express route providing local service starting at Ladysmith Drive serving Great Eastern Avenue, Kelsey Drive, Goldstone Street, Seaborn Street, Bambrick Crescent and Thorburn Road with nonstop express service to Memorial University. This route operates one (1) morning trip starting at 7:35 am and arriving at Memorial University at 8:00 am.

Route 16 - Service between Kenmount Terrance to the Avalon Mall terminal, Health Sciences Centre and Memorial University increased on Saturday evenings until 11:10 pm and Sunday evenings until 6:10 pm.

Route 20 - Service between the Avalon Mall and Airport Road at Major Path and serving the Health Sciences Centre and Memorial University extended on Saturdays between 8:30 am until 6:30 pm.

### 5.4.2 Transit Route Review

The last route review was conducted in 2007. A study of a U-Pass program will include a review of service to the university and possible realignment of service or additional service to meet student ridership. (More discussion on the U-Pass program is included in Appendix E).

### 5.4.3 Express Bus Service

Frequent, direct transit service encourages more commuters and travellers to take public transit. Providing express service between transit terminals with convenient transfers to local service and express service from park-and-ride sites to major destinations can improve travel times.

### 5.4.4 Accessible Transit Routes

Presently, paratransit services are contracted by the City of St. John's. Metrobus does not offer accessible transit service. Providing trips to persons with mobility challenges on regular transit service is much cheaper than providing those trips using door-to-door service and provides the transit customer with frequent travel times compared to door-to-door service, which may not be available at convenient times for the traveller. Accessible transit service requires careful planning. Bus stops and shelters must be identified as accessible and free of barriers, destinations must be fully accessible, and information on which routes and stops are accessible must be promoted. Metrobus has replaced most of the buses in the transit fleet with accessible, low floor vehicles. Accessible, low floor bus service not only provides easy access to persons using mobility aids such as wheelchairs and scooters, but also for persons with limited mobility, seniors and persons with strollers.

### 5.4.5 Community Transit Service

Metrobus recently received funding to implement four (4) neighbourhood bus routes using a smaller bus than a standard forty (40) foot vehicle. Two routes will serve the eastern part of St. John's, with one route providing service from neighbourhoods around the Mount Cashel area, travelling along Elizabeth Avenue and include a stop at the entrance to Memorial University. Two other routes will serve the western part of the city.

### 5.4.6 Late Night Shuttle

Presently, transit service between the University area and downtown area ends around 12:30 am on weekdays and Saturdays.

### 5.4.7 Active Transportation

Active transportation and transit complement each other and provide multimodal travel options for travellers. Metrobus has recently tendered for the purchase of bicycle racks for all transit vehicles.

### 5.4.8 New Customer Programs

Programs such as "Guaranteed Ride Home" and "Request Stop" and stop announcements provide added value to the transit customer. A "Guaranteed Ride Home" program ensures employees that, if they are unable to take their usual mode home due to some emergency, they will have other options such as a subsidized taxi to return home.

A "Request Stop" program allows transit customers to request the bus operator stop at a location other than a regular transit stop during evening hours. Metrobus offers a "Request Stop" program during evening hours.

Stop announcements reduces uncertainty for persons with visual impairment or passengers travelling to new areas.

## Recommendations - Service Review:

- Routes 24 and 26 to provide express service with one (1) morning trip only. Due to fleet availability constraints, no evening return express trip is available. Staff should look at realigning other service to allow a return express trip on Routes 24 and 26 .
- Metrobus to conduct regular passenger counts and surveys to ensure transit routes are meeting ridership goals and performance.
- There is a high level of service along Prince Phillip Drive to the Health Sciences Center and Memorial University. Investigate if some service could be re-routed along Elizabeth Avenue and up Westerland Road to these institutions.
- Metrobus to investigate the implementation of an express bus network connecting major transit terminals and park and ride locations to major destinations.
- Metrobus to begin planning of accessible transit service on conventional transit routes considering transit routes that serve the Health Sciences Center and Memorial University as a priority.
- Metrobus to evaluate the response to the service with possible expansion of neighbourhood bussing to serve communities popular for off-campus student housing such as the Kenmount Terrace and Crosby Road areas.
- Metrobus to consider extending Friday and Saturday evening service by providing a late night shuttle between the terminal at City Hall/Mile One and the University. This service could be delivered using the smaller Community Transit vehicle.
- Metrobus to develop policies and procedures for providing bicycle travel on transit.
- Plan the installation of bicycle racks at transit terminals and major transit destinations.
- Work closely with the local cycling community to promote transit and cycling as a travel options.
- Metrobus investigate the introduction of a "Guaranteed Ride Home" program for Metrobus customers.
- Metrobus consider the introduction of stop announcements at transit stops and destinations.

## 6 Transportation Demand Management \& Parking

### 6.1 Introduction to TDM

### 6.1.1 What is Transportation Demand Management?

Transportation Demand Management (TDM) involves the use of various policies, programs, services and products to influence the manner in which people travel. The idea of TDM is to motivate people to travel using different modes of transportation including walking, cycling, transit and ridesharing. TDM can also motivate people to make fewer trips on the road network through, for example, technologies that allow people to work from home, and shop online. TDM also encourages people to drive more efficient by planning trips that accomplish a number of goals and that avoid peak traffic periods and congested routes. Many large employers and Universities throughout North America have typically embraced TDM as means of providing a comprehensive coordinated set of programs and services that address a range of common transportation issues such as congestion, parking, infrastructure needs, pedestrian safety and greenhouse gas emissions.

### 6.1.2 Who Benefits from Transportation Demand Management?

Communities, large employers, and the employees of organizations with a good TDM plan will all benefit in the end.

The City of St. John's would enjoy better returns on their investments in transit, walking, and cycling facilities. TDM leads to cleaner air, less congestion and lower health care costs. For larger employers such as Memorial University, Eastern Health and the Provincial Government, TDM allows for easier employee recruitment and better employee retention.

For individuals that take advantage of TDM programs and services, they have greater choices and convenience, they save both time and money, and they reap the benefits of a healthier more sustainable lifestyle.

### 6.1.3 Why a TDM Plan is Necessary?

Maintaining a balance between supply and demand is a crucial element of any transportation system. It is also good business for Municipalities, many of whom already have successful recycling and water conservation programs offering real economic benefits and social benefits to the community. Many Municipalities have also realized that their transportation infrastructure is also a valuable resource that has to be managed properly to avoid costly and unnecessary upgrades.

By properly managing the demand for travel, Municipalities can, and have in some instances, reduce the need for new or widened roads, reduce the environmental and social costs of car use, and have increased their return on the investments they have made in walking, cycling, transit and ridesharing throughout the communities they manage.

Transportation Demand Management \& Parking

### 6.2 Public Transit and TDM

### 6.2.1 Introduction

Transit systems have an important role in Transportation Demand Management. Transit systems have managed demand through marketing, pricing and promotion strategies. TDM measures including investment in public transportation together with integrated land use can effectively address growing traffic congestion and its associated effects on a city and municipality. Investment in public transit reduces vehicle traffic and associated greenhouse gases and harmful pollutants.

Public transit's role in Transportation Demand Management is to promote a transit culture through marketing and awareness of public transit, make transit easy to understand and use by providing adequate and clear transit information, trip planning, customer information and real-time transit information using displays, online and wireless devices, and making transit affordable through such initiatives as employer provided and universal pass programs, discounted transit fares and electronic fare media.

Setting targets for shifting trip demand from cars to transit, matching future settlement locations to take advantage of best transit opportunities and boosting investment in transit can avoid the need for major roadway projects and result in overall savings in capital investment. Investment to strengthen traditional transit services, introduce new services such as Bus Rapid Transit (BRT), Express Bus service and other service delivery options and investment in modern transit vehicles, transit priority measures and improved customer facilities and amenities can focus on achieving these targets.

Using Intelligent Transportation Systems (ITS) such as Automated Vehicle Location (AVL), Automated Passenger Counting (APC), Real-Time Transit Information, Trip Planner Systems and Automated Fare Collection (AFC) results in better management of transit operations, transit service planning and improved customer convenience, attracting new ridership.

Placing emphasis on the marketing and promotion of public transit to increase awareness and use of transit includes strong design and branding to maintain an image of a modern, efficient and reliable transit system, introducing customer loyalty programs and added value services such as "Guaranteed Ride Home" and "Request Stop" programs, stop announcements and real-time route and schedule information, all contributing to the public's perception of the transit system and the customers' transit experience.

Modal integration of public transit with other TDM measures, such as active transportation initiatives, can boost transit ridership by making transit a part of the overall trip. This can be achieved through the installation of bike racks on buses, bicycle storage at transit stops and terminals and direct and accessible walking paths to and from transit facilities.

Transit systems, in partnership with city government and other agencies such as schools, universities and employers, can work together to develop programs and projects that benefit all parties.

Transportation Demand Management \& Parking

### 6.2.2 Knowledge and Awareness - Marketing Transit

Marketing activities by public transit are a form of TDM. There are several aspects of marketing public transit to bring awareness and knowledge of a transit system. These activities include branding and positioning, target marketing, special events, customer information, fare incentives, partnerships and research to promote and encourage transit use.

### 6.2.3 Transit Orientated Design (TOD)

Transit Oriented Design (TOD) is the creation of compact communities centered on high quality transit service with high density development within walking and cycling distance of a main transit terminal with local transit services supporting the main line.

Sustainable development and transit-oriented design have several direct benefits including increased transit use and revitalized neighbourhoods creating development opportunities and enhanced economic development as well as increased land values, increased labour pool access and affordable housing. Benefits also include reduced traffic congestion, increased property tax revenues, reduced crime, reduced infrastructure costs and preserves open spaces. Transit Oriented Design should take advantage of transit opportunities to ensure that future development is located and designed to make the best use of transit investment.

Well planned Transit Oriented Design offers several benefits such as greater mobility for moving around the community, increased transit ridership, reduced traffic congestion, accidents and emissions, reduced household spending on transportation, higher property values and a healthier lifestyle for the residents.
> "Smart Growth" is defined as land use and development practices that enhance the quality of life in communities preserve the natural environment and save money over time. This is achieved through the comprehensive use of alternative development standards and strategies that reduce the impact of urban growth on the natural environment, integrate infrastructure in ecosystems, thus reducing its cost, and create more liveable communities that increase our enjoyment of the places we live in."

- Smart Growth BC

### 6.2.4 Active Transportation and Transit

Promoting active transportation such as walking and cycling is a key element to improve the health of a community's residents. Transit and active transportation complement each other and offer a suite of travel options that help individuals adopt multimodal lifestyles and minimize automobile use.

Transit friendly design including safe and convenient walking and cycling paths from high density development to local transit terminals can encourage increased use of walking, cycling and public transit. By providing conveniences such as walking paths to transit stops and bike paths, bike storage at transit terminals, bike racks at key destinations, and bike-rack equipped buses for cyclists, there is greater
encouragement for individual to combine walking and bicycle travel with public transit. Initiatives such as free transit trips to bicycle users and interactive route maps of cycling and transit routes can further encourage this activity. In some cases, the installation of bike racks at downtown transit stops may be cost shared between the city or transit agency and local businesses and they benefit both parties.

Providing bicycle storage at transit terminals and stops can extend the service area of the transit route by attracting cyclists who travel further than the walking distance to the transit service.
"Transit and walking have a strong relationship. Research shows that the willingness of passengers to walk to a transit stop increases with the quality of both transit service and the pedestrian environment, a dynamic that yields larger transit catchment areas and higher ridership."

- Cervero, R. and Seskin, S. - An Evaluation of the Relationship between Transit and Urban Form TCRP Research

### 6.2.5 Transit and Parking

Parking management measures has a direct influence on public transit use, especially in downtown and areas of high employment. Such policies as parking pricing, regulated parking and limited parking duration can encourage other modes of transportation.

City owned parking rates can be set to encourage transit use. In Kelowna, British Columbia, city owned parking facilities parking rates are set at a minimum of $10 \%$ higher than a monthly bus pass. Cities can also redirect parking revenues to fund improve transit service and facilities in the downtown area making transit use more attractive.

### 6.2.6 Transit Priority Measures (TPM)

Transit Priority Measures (TPM) are used in most major cities to improve transit service, avoid congested intersections and reduce delays in service. Transit Priority Measures include regulatory measures, physical measures and transit signal priorities. Transit Priority Measures combined with limited stop service can make the bus travel competitive with automobile travel along the same route.

## Regulatory Measures

Figure 20: Regulatory measures transit signs

## Physical Measures

Physical measures include exclusive transit lanes or high occupancy vehicle (HOV) lanes, queue-jump lanes, bus gates and busways. Transit lanes and bus ways are restricted to public transit vehicles only.

High Occupancy Lanes are restricted to vehicles carrying more than one person. Transit lanes may be open to general travel during off-peak travel periods.

Figure 21: Ottawa’s Busway

Figure 22: Quebec City's Bus Only Lane

## Transit Signal Priorities

Transit signal priorities are signalized intersections that give transit vehicles
 priority over other traffic through the intersection. Transit signals are usually combined with queue-jump lanes allowing the bus to enter the intersection ahead of other traffic heading in the same direction. This is accomplished by an indicator signalled to the bus to enter the intersection while other traffic at the intersection is stopped with a red light. This can be scheduled for every light change, during peak travel times only or by the bus activating the signal.

Figure 23: Typical Bus Priority Signal

## Bus Gates and Bus ONLY Crossings

Bus gates and bus only crossings are used in locations to provide priority connections between areas and communities for transit and emergency vehicles only. Bus gates and bus only crossings permit buses to provide direct transit connections reducing route length and travel time.

Figure 24: Calgary Transit Bus Gate and Bus Only Crossing

## Transportation Demand Management \& Parking

### 6.2.7 Intelligent Transit Systems (ITS)

Intelligent Transportation Systems are technologies used in the transit industry to provide data to transit operators to plan and manage transit service and provide travel information to transit customers. Computer and communication systems are integrated to provide effective management of the transit system by monitoring on-road service, schedule adherence, passenger count and fare collection. This information can be communicated to transit users advising the location of their bus and expected arrival times at their stop. Travel planner applications assist transit users plan their transit travel and automated fare collection allows customers fare payment options and ease of fare payment.

### 6.2.8 Automated Vehicle Location (AVL)

Automated Vehicle Location systems allows transit dispatchers to monitor the actual location of vehicles along transit routes and indicate vehicles that may be running behind or ahead of schedule where corrective action can be taken. Using this information, transit passengers can then be informed of the expected arrival time of their bus. AVL systems can include Automated Passenger Counting (APC) features can be provide important data collection for route and schedule planning and improve schedule adherence, service frequency and service reliability.

### 6.2.9 Real-Time Transit Information

Real-Time transit information systems provide transit passengers with information regarding the arrival times of buses serving their stop. This information can be provided by phone, text, online and e-mail and displays at transit terminals and major stops.

### 6.2.10 Trip Planner

Trip planning systems use technology to assist transit users plan their transit travel. Passengers can enter their location and destination and the system will provide information including the bus stop to start from, which route to take, the departing time of the bus, any transfers involved, how long the trip will take and what the fare will be.

Many systems include alerts and notifications to smart phones and other devices indicating when a bus is departing from a bus stop.

Transportation Demand Management \& Parking
6.2.11 Automated Fare Collection (AFC)

Automated Fare Collection (AFC) systems provide simple userfriendly fare collection, offering transit customers convenient and

Figure 25: Smart Card Fare Payment flexible methods of fare payment. Automated fare collection improves fare collection security and provides transit management with important data collection and reporting information. Automated fare collection speeds boarding times, reduces fare disputes between bus drivers and passengers, reduces fare fraud and can eliminate the need for bus transfers. There are a variety of AFC systems available on the market ranging from electronic fare boxes to contactless smart card processors with wireless data transfer, GPS information and data reporting.

### 6.2.12 Universal Bus Pass Program (U-Pass)

Universal Bus Pass (U-PASS) programs are offered to many universities and colleges across Canada. A UPass program gives full-time students the opportunity to travel public transit at a deep discounted fare. All full-time students are enrolled in the program and the cost is added to the student tuition and registration fees. U-Pass programs have resulted in significant increases in student use of public transit. A more detailed discussion of the U-Pass program is included in Appendix E.

### 6.2.13 Employer Provided Bus Passes

Many transit agencies have partnered with major employers to provide employer provided transit passes to their employees. Often referred to as an EcoPass program, it is designed to make public transit as an attractive and affordable option to the automobile for work commutes. Bus passes are provided to employees through payroll deductions. Employers who wish to subsidize the program can offer passes to employees at a discount or the transit agency can sell the passes at a reduced cost to the employees.

Employer provided bus pass programs have shown considerable increases in transit use by employees.
"Many employers offer free or subsidized parking as a benefit to their employees. This access to free or inexpensive parking reduces commuting costs for automobile users and provides a disincentive to transit use. In several jurisdictions, employer-sponsored bus pass programs have been implemented to reduce commuting costs for transit users, to reduce the demand for parking, to provide a more equitable benefit program to employees, and to make the purchase of transit passes more convenient. The natures of these programs vary. In some instances, employers provide a direct subsidy to employees for the purchase of bus passes. In others, employees are able to buy annual passes through a payroll deduction plan."

- Winnipeg Transit EcoPass

### 6.2.14 Service Delivery

Public transit is more than conventional fixed route service. Service delivery is tailored to the customers varying needs from commuter rail and bus rapid transit to express routes, neighbourhood routes and shuttle and van services. A transit system can offer a suite of service options to the public.

## Conventional Fixed Route Transit Service

Conventional or fixed route transit service must provide a network of transit routes throughout the service area. These routes must be monitored carefully to ensure schedules and connections to other routes and services are maintained

## Bus Rapid Transit (BRT)

Bus Rapid Transit (BRT) is a higher order transit service offering commuters a high quality, rapid transit service that is customer-focused, fast, affordable, comfortable, accessible and reliable. BRT has many important features including safe, comfortable and attractive stops and stations, park and ride facilities, frequent, limited stop service to key destinations and upgraded transit vehicles. A number of transit priority measures such as transit signal priority can be employed to provide buses with a travel advantage over automobiles travelling the same routes.

BRT buses provide upgraded customer comfort features such low floor accessibility, high-backed seats, additional leg room, air conditioning and noise dampening interiors. BRT vehicles, shelters, stops and promotional materials are branded in a strong, easily recognizable color scheme and logo.

Bus Rapid Transit terminals and stations offer customers amenities such as indoor seating, bicycle storage, transit route and schedule information, washroom facilities, Wi-Fi, coffee, newspaper and food service in a well-lit and secure area.

Intelligent transportation systems such as automated vehicle location and real-time passenger information are used to make the service convenient to customers.

Figure 26: Saint John Transit's "Comex" Service

Figure 27: Saint John Transit's "Comex" Park \& Ride" BRT service

Figure 28: Halifax's "MetroLink" BRT service

## Express Bus Service

While Bus Rapid Transit offers a higher order transit service, express bus service operated by public transit systems provides direct, limited stop service, usually from high residential areas, to major commuter destinations. Express bus service operates frequent trips during peak travel periods with reduced service off-peak.

Figure 29: Halifax's MetroX service provides express service from rural communities into downtown

## Shuttle and Van Service

Shuttle and van service provides travel from smaller residential areas to the nearest transit terminal or transfer point where passengers can connect to main transit routes. Shuttle and van service can operate in areas where it is not economical to operate conventional bus service. This type of service can be fixed route or demand based.

## "Neighbourhood" Bussing

"Neighbourhood" bussing is a local community shuttle bus service (usually using smaller buses) circulating within a community and connecting to the main transit network. "Neighbourhood" service allows residents to travel, particularly for short trips, throughout their community for shopping, medical appointments, educational and social activities. Commuters can take a local bus to connect to other transit routes and services for longer trips.

## Subsidized Taxi Service Program

In areas where regular transit service is not viable or during hours when transit service is not available, a transit system may offer subsidized taxi service to registered customers. Subsidized taxi programs are often used to provide additional accessible transit service.

## Special Events

Providing transit shuttle service to special events such as concerts, air shows, parades and other public events can attract riders who would normally not take transit. This gives the transit system an opportunity to show how effective and convenient transit can be and encourage greater transit use.

## Park-and-Ride Facilities

Providing park-and-ride facilities are an effective way of increasing transit use and ridesharing especially during peak travel times. Park-and-ride facilities combined with frequent transit service are an effective method of reducing automobile traffic especially into the downtown. Park-and-ride facilities are often located at transit stations and bus stops on the outer edges of the city with frequent limited stop service into the downtown.

Figure 30: Park-and-Ride utilizing a City Owned Vacant Gravel Lot

Local transit service in outlying communities can use park-and-ride lots as a transfer point to a main haul line into the downtown area.

Park-and-ride facilities can range from paved lots at major locations to modest gravel lots. Major facilities include sheltered waiting areas, transit route and schedule information, waste cans, newspaper bins, washroom facilities, bicycle storage, security cameras, landscaping, and coffee and food services. Underutilized mall parking lots in partnership with the mall owners are often used for park-and-ride locations s there is a mutual benefit in that commuters will often shop at the mall since they area parking there and many of the customer amenities are available within the mall.

Preferential parking spots at park-and-ride facilities can be reserved for accessible vehicles, carpooling and vanpooling customers. Parking is usually free or at a modest charge to the commuter.

Figure 31: Major Park-and-Ride facility at a BRT station fully paved \& accommodates 230 vehicles

## Bike and Ride

Most park-and-ride facilities include bicycle paths, secure bicycle storage and bike racks on the buses serving the facility. Bus racks installed at major destinations encourage bicycle and transit use.

Figure 32: Example of a bicycle storage facility

## Kiss and Ride

Kiss-and-Ride is a designated location at park and ride facilities or transit terminals for commuters who are being dropped off and picked up by private vehicle.

Figure 33: Kiss-and-Ride Sign

Transportation Demand Management \& Parking

### 6.2.15 Bus Stops and Transit Waiting Areas

A customer's experience while waiting for a transit bus has a direct impact on the decision of using public transit and satisfaction of the transit service. Bus stops and waiting areas communicate the reputation and quality of the transit service. Bus stops and waiting areas should be designed to be functional, attractive and safe and well-maintained to the customer's waiting experience.

Waiting for a bus should be a comfortable, safe and positive experience. Bus stops should be easily identified conveniently located with easy access and provides adequate amenities for transit riders. Passenger amenities include comfortable seating, bus shelters, garbage and recycling containers, signage, route maps and timetables, bicycle racks and storage, lighting, video surveillance, and landscaping. All bus stops and waiting areas should be fully accessible.

Bus stops and waiting areas should be located according to standards considering spacing, traffic, passenger volumes, visibility and access. Bus stops can be categorized from basic stops to high use waiting areas with appropriate amenities assigned to each.

### 6.2.16 Transit Security

Over the past decade, transit systems across North America have been reviewing and improving security offering employees and passengers a measure of comfort and safety. The use of electronic surveillance on buses and at transit facilities, introducing rules of the conduct for transit passengers and introducing transit security and policing policies have become a priority with most transit agencies.

Transit facilities including terminals, bus stops and waiting areas can be designed following CPTED (Crime Prevention through Environmental Design) strategies. These strategies include natural surveillance, natural access control, territoriality, activity support and maintenance, defining the ownership of an area, increasing security by placing physical features, activities and people to maximize visibility in an area and maintaining the area in good repair to reduce the likelihood of criminal activity and convey a sense of security.
"CPTED is a proactive design philosophy built around a core set of principles that is based on the belief that the proper design and effective use of the built environment can lead to a reduction in the fear and incidence of crime as well as an improvement in the quality of life. CPTED goes well beyond conventional approaches to safeguarding the environment by exploiting natural forms of surveillance, access control and territorial reinforcement in a deliberate attempt to present psychological deterrent for the purpose of positively influencing human behaviour as people interact with the environment."

- CPTED Ontario

### 6.2.17 Other Initiatives

There are many other initiatives to improve transit service and increase ridership.

## "Yield to Bus" Legislation

Yield to Bus legislation requires traffic to yield to transit vehicles entering traffic from bus stops improving service reliability and reducing accidents involving transit vehicles and other traffic.
Yield to Bus legislation is now in place in a number of provinces including Ontario, British Columbia, Quebec and Nova Scotia.

Figure 34: Yield to Bus Sign

## Cars for Transit Passes Program

Programs such as the "Retire Your Ride" and B.C.'s "Scrap-it" programs offer individuals incentives such as transit passes, bicycles, car sharing memberships and cash to retire older high polluting vehicles.

## "Guaranteed Ride Home" Program

A "Guaranteed Ride Home" program is a transportation demand management measure designed as an incentive for commuters to use other modes of transportation such as walking, cycling, carpooling, vanpooling or transit. These programs can be offered by the transit agency and/or employers. The program guarantees that if employees are unable to take their usual mode home for unforeseen reasons such as some emergency or unexpected overtime, they will have access to other travel options such as a subsidized taxi ride home.

Individuals can register with the program providing their usual commute information or employers can register for employees who use an alternate mode of transportation to the automobile for all or a portion of their commute.

Programs provided by the transit agency can be offered in a variety of ways and limited to a small number of times of use a year. A "Guaranteed Ride Home" program is especially attractive to customers traveling from outlying areas where transit service may be infrequent and/or ends in early evening. Since use of a "Guaranteed Ride Home" program is seldom used, it is inexpensive to operate while offering customers the assurance that they will have a travel option should they be unable to use their regular mode of transportation.

Transportation Demand Management \& Parking
"Request Stop" Program
A "Request Stop" program offers any transit customer feeling vulnerable the opportunity to disembark the bus at a location other than a designated bus stop if they make a request to the bus operator. T The program is usually in effect during evening hours only. The bus operator will oblige the request provided the operator can stop safely. This program improves safety for passengers by reducing their walking distance, especially at night.

## Bus Stop Announcements

Stop announcements can be made either by the bus operator or in conjunction with a GPS or AVL system. Major stops and transfer points are announced on the bus improving the transit experience and reducing uncertainty for passengers, particularly those with visual impairment and travelers to new destinations.

## Real-Time Bus Arrival Alert

A real-time bus arrival alert system delivers text messages to transit users notifying them of the arrival time of their bus. Alerts are up-dated in the case of bus delays. A real-time bus arrival alert system improves customer satisfaction, reduces uncertainty and improves security by reducing waiting times.

## Customer Loyalty Programs

Many transit agencies offer loyalty programs to reward regular transit users and attract new customers. These can range from discounted fares for bulk tickets and monthly bus passes to free transit days or award programs such as the Air Miles reward miles program offered by Metrobus in St. John's.

## Transit Tax Credit Program

Increasing the use of public transit helps ease traffic congestion and reduce air pollution. To encourage greater use of transit, reduce traffic congestion and air pollution, and help make transit more affordable, the Government of Canada launched a non-refundable tax credit on July 1, 2006. Some provinces including Nova Scotia offer a provincial transit tax credit as well.
Transit agencies can use value of the Transit Tax Credit Program to transit users in marketing their service.

### 6.3 Parking and TDM

There are approximately 3,500 parking spaces on Campus and another 1,300 on the periphery and in locations adjacent to the Health Sciences complex. With a student population of just under 15,000 and a faculty and support staff of some 4,100 employees parking is in high demand on the MUN Campus.

Table 14: Parking throughout MUN Campus

| Type | Organization | Number of Spaces |
| :--- | :---: | :---: |
| Permit Parking | MUN | 2807 |
| Pay \& Display Parking | MUN | 438 |
| Metered Parking | MUN | 242 |
| Private Parking | MUN | 207 |
|  | Total MUN | $\mathbf{3 6 9 4}$ |
| Surface Parking | Eastern Health Centre | 1907 |
| Surface Parking | MUN Private | 185 |

As part of most TDM programs, parking is typically priced as a parking management strategy to reduce parking problems in specific areas or as mobility management strategy to help reduce the vehicle trips in an area. It can also be priced to recover capital costs for new parking facilities over prescribed time periods. The table above, reflects the parking after Lot 16 was removed to make way for the construction of the Core Science Facility.

### 6.3.1 Costs of Parking on Campus

While there are slight variations in the cost of parking between different parking lot facilities on Campus, it should be highlighted that the overall cost of parking on Campus is well below what would be considered a reasonable market rates. The cost for a student parking permit is very low relative to demands. Students typically have to be in their second year and have to enter a draw to obtain a parking permit. The cost of parking for staff and faculty are slightly higher. These rates do not cover the maintenance and operations cost of existing parking, nor do they cover the capital expense of constructing parking spaces.

### 6.3.2 Collective Agreements

As part of the MUNFA collective agreement, each academic staff member is entitled to one parking space with reasonable walking distance of his or her office. Rates are tied to previous years and increases in rates are limited to prescribed amounts on a yearly basis. Similarly, the CUPE 1615 agreement also restricts the extent to which parking fees can be increased; limiting the yearly increases to the consumer price index.

The low cost of parking on Campus and the inability of the staff to easily change that because of the collective agreements encourages the single occupant vehicle use and a whole range of related problems that go along with that including peak hour traffic congestion, low transit usage, and pedestrian safety concerns.

Transportation Demand Management \& Parking
Memorial University needs to completely separate parking from their collective agreements. In doing so, they will be able to increase rates and influence the transportation choices the students and staff and faculty members make on a daily basis. Parking pricing is an integral component of any successful TDM strategy.

### 6.3.3 HOV Priority

High Occupancy Vehicle (HOV) priority refers to strategies that give priority high occupant vehicles, including transit buses, vanpools and carpools. While many of the strategies provide operation advantages to HOV vehicles, there are also parking strategies that can be utilized to encourage ridesharing including parking discounts and preferred parking locations.

### 6.4 Cycling/Walking and Active Transportation

### 6.4.1 Cycling Plan

In 2010, the City of St. John's started to implement the first phases of its cycling master plan. Although not as robust as plans presently in place in other major centres throughout Canada it is a start and provides a foundation upon which to expand.

### 6.5 Study Area TDM Strategies/Recommendations

Strategy 1: Partnerships to promote sustainable transportation and awareness of the benefits of public transportation.
The Health Sciences Center, Memorial University and Provincial Departments located at the Confederation Building in St. John's to partner with Metrobus in encouraging greater use of public transportation bus their students and employees as part of their sustainability initiatives.

## Strategy 2: Improve transit facilities to improve bus access and customer amenities using transit-friendly design guidelines.

Bus passenger pick-up and drop-off locations serving Memorial University are located at the bus terminal on Artic Avenue, and stops on Westerland Road and Elizabeth Avenue. Stops on Clinch Crescent serve the Health Sciences Center and the Confederation Building is served with a stop at the main entrance adjacent to Prince Phillip Drive and bus stops along Allandale Road.

Thirteen (13) bus routes serve Memorial University at the Artic Avenue terminal, two (2) routes serve the university along Elizabeth Avenue, six (6) Routes serve the Health Sciences Center and three (3) routes serve the Confederation Building.

The Artic Avenue terminal in particular lacks adequate room for bus pick-ups and drop-offs. During peak travel times, as many as five (5) buses can be in the terminal at one time. Space for passenger pick-ups and drop-offs is only available on one side of the street requiring buses travelling routes that provide service in both directions to circle the building to continue the route. This, combined with parked vehicles and automobile traffic, creates unsafe conditions for passengers boarding and exiting buses. All three locations

Transportation Demand Management \& Parking
require improvements to bus access and boarding and drop-off areas, appropriate waiting areas, bus shelters, walking and bicycle paths and bike racks and storage.

## Strategy 3: Partnerships to promote active transportation initiatives.

Active transportation and transit complement each other and encourage a multimodal lifestyle. Every transit trip starts and ends with another mode of transportation with the bus user traveling to and from a bus stop by walking, cycling or using a mobility device such as a wheelchair or motorized scooter. Metrobus vehicles are all accessible low floor vehicles. Metrobus is now in the process of tendering for bicycle racks for all transit buses. Memorial University, the Health Sciences Center, and the Provincial offices located in the Confederation Building should promote public transit a part of their active transportation initiatives. The development of good walking and cycling paths to transit terminals and the installation of bicycle racks and storage will encourage greater opportunities for combining active transportation options with public transit.

## Strategy 4: Develop parking policies that encourage greater transit use.

There is a strong relationship between parking availability, parking rates and transit use. Memorial University, the Health Sciences Center and the Provincial Departments at the Confederation Building should review their respective parking policies to reduce competitiveness with public transit. Measures could include ensuring parking rates are near or above the cost of a monthly transit pass, subsidizing transit passes for employees in lieu of parking and limiting parking duration. The introduction of a U-Pass and/or EcoPass program would be an excellent opportunity to introduce revised parking policies.

## Strategy 5: Investigate the use of transit priority measures to reduce transit travel times and improve schedule adherence and on-time performance.

The installation of transit priority signals, queue-jump lanes and other transit priority measures improve travel times and on-time performance making bus travel more competitive to automobile travel times along the same route. Metrobus has looked at a number of intersections where transit priority signals would improve the transit service. In particular, intersections along Prince Phillip Dr. should be considered for priority signals and queue-jump lanes. Transit priority signals at Prince Phillip Road and Clinch Crescent/Westerland Road, Prince Phillip Drive and Morrissey Road, Prince Phillip Drive and Portugal Cove Road have all been identified as intersections where transit service would benefit from transit signal priority measures.

## Strategy 6: Use Intelligent Transportation Systems to improve transit service.

Intelligent Transportation Systems such as Automated Fare Collection, Automated Vehicle Location, Transit Trip Planner and Real-Time Passenger Information Systems provide important information to both transit users and transit planners and dispatchers.

[^0]Transportation Demand Management \& Parking
U-Pass programs established in other universities have seen significant increases in student use of public transit. Improved transit service funded by a U-Pass program not only benefits students but all transit customers. Metrobus is undertaking an initiative to negotiate a U-Pass program with Memorial University in the coming months.
The study area is a major employment node in the City of St. John's. The development of an EcoPass program for faculty and employees of Memorial University and employees of the Health Sciences Center and Confederation Building would increase transit use in the area. The introduction of a U-Pass program for Memorial University students and an EcoPass program for employees would be a major incentive for increased transit use in the area, transit use in the area would see significant increases.

## Strategy 8: Develop a "suite" of service delivery options for public transit.

One of the challenges to providing effective public transportation is meeting the diverse needs of its customers. Commuters, students, seniors, persons with limited mobility, all have different lifestyles and travel for different reasons. By developing a "suite" of service delivery options, the transit system can meet many of these needs. Metrobus has recently introduced two morning express trips to the study area and have plans for four (4) community transit routes, one of which will serve the study area. Increasing express bus service during peak travel times, developing park and ride sites with direct, limited stop service to the area and implementing accessible transit routes would encourage greater travel use.

## Strategy 9: Adding value to the transit experience

Providing programs such as "Guaranteed Ride Home" and "Request Stop" programs and stop announcements provide extra value to the transit customer. Metrobus now offers the Air Miles rewards miles program to customers using the Metrobus M-Card fare payment system and a "Request Stop Program" during evening service.

## Strategy 10: Develop park-and-ride sites strategically located at the periphery of the urban core with express bus service into the study area.

The need for public transportation extends beyond the metropolitan area and into neighbouring and smaller communities. Developing park-and-ride facilities at the periphery of the urban core with express service to major destinations can extend the reach of the transit service. Sites to consider would be park-and-ride facilities to capture commuters from Conception Bay South, Paradise and Mount Pearl.

## 7 Crosswalks \& Pedestrian Safety

As with any university campus, the main method of travel throughout the campus is walking. Throughout the study area, there are over 70 pedestrian crosswalks, some at signalized intersections and others at midblock crossings. Some of the crosswalks are across high vehicular corridors with high speeds. Eight different locations were identified throughout the study network with high vehicular volumes and speeds and also have a high volume of pedestrians crossing at these specific locations. These eight locations were assessed using the TAC - Pedestrian Crossing Control Guide as discussed below in Section 7.1. Other crosswalks throughout the MUN Campus have a high volume of pedestrians, however are more internal and on internal roadways. A total of 14 locations were selected for crosswalk assessments and is discussed below in Section 7.2.

### 7.1 Pedestrian Crossing Control Assessments

There are eight crosswalks throughout the MUN Campus that are extremely busy with pedestrian traffic as well as vehicular traffic. Traffic and pedestrian counts were collected at eight intersections, by HTC, to complete a pedestrian crossing control assessment and determine the adequate pedestrian crossing control at each location. The detailed pedestrian counts can be found in Appendix A. The crosswalks listed below were counted and are shown in Figure 35 with respect to the MUN Campus.
(1) Clinch Crescent/Bridge

2 Arctic Avenue/Kerwin Place
3
Westerland Road/Pedagogue's Close
4 Westerland Road/Lambe's Lane
(5) Elizabeth Avenue/Newtown RoadElizabeth Avenue/Rodney Street Livyer's Loop
8 Allandale Road/Civic Address \#84-86

Figure 35: Crosswalks throughout the MUN Campus

Crosswalk \& Pedestrian Safety
Each of the crosswalk locations mentioned above were analyzed using the TAC - Pedestrian Crossing Control Guide, this included the following minimum requirements/parameters to continue with the crosswalk assessment:

- Greater than 15 EAU's (Equivalent Adult Units)
- A minimum of 100 pedestrians over a 7-hour continuous counting period
- A minimum of 1,500 vehicles per day.

If all of the above requirements were met, the assessment continued to analyze the average daily traffic and speed limit of the roadway with the total number of lanes the pedestrians would be crossing. From the analysis, three treatment selections were selected for the above intersections and descriptions can be found below:

- Ground Mounted System - There are two options with this type of system, one includes having a crosswalk with side-mounted signs and the second option is to have a crosswalk with overheadmounted signs. Neither option has a flashing beacon or a push-button application.
- Overhead Flashing Beacon System - This system is considered to be a special crosswalk due to the overhead mounted system with flashing beacons and push-button application.
- Traffic Signal Systems - This system provides pedestrian crossing opportunities using traffic signals (red, amber, green).

## Discussion of the Results

After completing a pedestrian count and assessment at each of the pedestrian crossings, three things were common at each pedestrian crossing:
a. All eight pedestrian crossings zebra crosswalk markings were either completely worn away or barely visible to both the pedestrians and motorists. These should be replaced/repainted at each pedestrian crossing.
b. WC-2 signs should be placed on each approach in advance to the pedestrian crossings to warn/advise the motorists of a crossing ahead.
c. At the locations where there are yellow or red flashing beacons, they must be removed as they are not part of any code or regulation.

Six pedestrian crossings warranted a ground mounted system with side mounted signs:

- 2 Arctic Avenue/Kerwin Place
- 5 Elizabeth Avenue/Newtown Road
- 3 Westerland Road/Pedagogue's Close
- 6 Elizabeth Avenue/Rodney Street
- 4 Westerland Road/Lambe's Lane
- 7 Livyer's Loop

One pedestrian crossing warranted a Ground Mounted System with an overhead mounted signs:

- 1 Clinch Crescent/Bridge

One pedestrian crossing warranted an Overhead Flashing Beacon System:

- 8

Allandale Road/Civic Address \#84-86

Please note that the above pedestrian controls are the minimum requirements at these specific locations. If the existing pedestrian crossing control is a higher pedestrian crossing control which is deemed adequate.

### 7.2 Crosswalk Assessments

The study team reviewed the crosswalks throughout the MUN Campus and 14 crosswalks were selected to have a crosswalk assessment completed to determine any deficiencies. The 14 locations are identified on Figure 36 (A through N ) and the detailed results can be found in Appendix A.

| A Clinch Crescent/Mosdell Road | Livyer's Loop \#3/Phelan Road |
| :--- | :--- |
| B Clinch Crescent/North Parking Lot | Livyer's Loop \#4 |
| C Clinch Crescent/Arctic Avenue | Burton's Pond Road/Phelan Road |
| D Irwin's Road | Burton's Pond Road \#4 |
| E Irwin's Road under the overhead walkway | Lurton's Pond Road \#3 |
| E Loop off of Elizabeth Avenue | $\mathrm{M}_{\text {Burton's Pond Road \#2 }}$ |
| G Livyer's Loop \#2 | $\mathrm{N}_{\text {Burton's Pond Road \#1 }}$ |

Figure 36: Overall Layout of Crosswalk Assessments

## Discussions of the Results

The 14 crosswalk locations were assessed with the following parameters:

- Pavement Markings
- Wheelchair Accessibility
- Signage
- Stopping Sight Distance
- Street Lighting
- Parking
- Overall conditions

The above findings are detailed in Appendix A for each crossing and Table 15 below summarizes the findings.

Table 15: Pedestrian Crossing Summary

As shown above in Table 15, 12 of the 14 crosswalks require the pavement markings to be re-painted and the other deficiencies, noted above, require attention.

### 7.3 Internal Network

There are various pedestrian paths throughout the MUN Campus involving underground pedestrian tunnels, pedestrian overhead walkways and exterior sidewalks. Most of the MUN Building network is connected with either an underground or overhead walkway however the new residences, as well as the residences around Burton's Pond Road, are only connected via sidewalks. Therefore, the only way for students in those residences to get to class is to navigate through the exterior MUN Network.

### 7.3.1 Livyer's Loop

Two new residences were constructed over the past couple of years, West Wing and East Wing on Livyer's Loop, each housing 250 students. This creates an addition of students, on top of the original 2,000, travelling to class throughout the day. Most students travel outdoors, use the sidewalks and crosswalks to create the most direct path to class. This in turn requires students to cross multiple roadways to get to their destination.

During the construction of these new residences, a portion of Livyer's Loop was designated a one-way only street, from Irwin's Road to the Doyle Residence. This controls the traffic flow and direction of the vehicles that are driving internally, either accessing parking lots for the buildings or residences. The only access point onto Prince Philip Drive would be a right-turn from Livyer's Loop by the Bowater Residence. Keeping Livyer's Loop as a one-way section for the portion mentioned above would reduce the amount of vehicles using the MUN Campus as a shortcut route.

### 7.3.2 Burton's Pond Road

Burton's Pond Road currently operates as a two-way road system with an access point on Allandale Road and two access points along Elizabeth Avenue. Burton's Pond Road has multiple parking lots for the residences, as well as a larger parking lot to access various buildings along Elizabeth Avenue. Therefore, there are vehicles entering this network at all times during the day.

The apartment style residences are also along this corridor and the only path to class for these students is to travel outdoors along the sidewalks, due to their being no tunnel system on this part of campus. There are various crosswalks along Burton's Pond Road that are marked with RA-4 signs and zebra marked crosswalks. However, throughout the winter these crosswalks wear away from the vehicle traffic and the snowplows, limiting visibility. Signage is required at the crosswalks along Burton Pond Road to warn motorists that they are approaching a crosswalk.

### 7.4 Pedestrian Safety

### 7.4.1 Roundabouts

Roundabouts significantly reduce the speed on the roadway, which in turn reduces the amount of road user collisions and also reduces the number of conflict points between pedestrians and vehicles from 24 to 8. Due to the reduction of conflict points and a slower speed travelling through the roundabout the likelihood of a pedestrian/vehicle injury is significantly less. Figure 37 shows the reduced conflict points between vehicle to vehicle as well as vehicle to pedestrian.

Figure 37: Conflict Points

### 7.4.2 Curb Extensions for Pedestrians

When vehicles are parked on the road, approaching vehicles have an obstructed view of the pedestrians waiting to cross the road. A curb extension is a traffic calming measure that extends the curb so that the approaching vehicle can see the pedestrian waiting to cross. This allows for the pedestrian to make eye contact with the driver and also reduces the crossing distance. Figure 38 shows an example of a curb extension.

There are three (3) main roadways throughout the MUN Campus that have adjacent parking on the street and it is recommended to install curb extensions:

- Westerland Road
- Burton's Pond Road
- Phelan Road

Figure 38: Curb Extensions with on-street parking

### 7.4.3 Pedestrian Tunnels and Pedways

Prince Philip Drive is a high traffic volume $70 \mathrm{~km} / \mathrm{hr}$ roadway that runs in an east/west direction through the center of the MUN campus. This roadway has caused many problems in the past with pedestrian safety. There are a number of pedestrian skywalks and tunnels that run across this roadway at the present time; one of which was just recently removed from service. Despite the availability of these grade separated walkways there remain two pedestrian routes that are still concerning.

The intersection of Morrissey Road and Prince Philip Drive is a signalized intersection at the present time. This traffic signal does provide a protected walk phase and signal indications for pedestrians crossing Prince Philip Drive in the north/south direction. Despite the protected pedestrian phase that has been incorporated within this traffic signal there remain conflicts and near misses at this location. The existing pedestrian tunnel near St. John's College has recently been upgraded to provide a usable grade separated link in this area of campus. A new multi-use underpass on the Morrissey to Livyer's alignment should be investigated as part of this closure of this intersection. This underpass may also be able to serve smaller maintenance vehicles.

The intersection of Westerland Road and Prince Philip Drive also handles a fair amount of pedestrian traffic as part of the traffic signal system present at this intersection. These crossings are accommodated along with the heavy traffic volumes present at this intersection which again is somewhat concerning. HTC is suggesting consideration be given to installing a series of skywalks that would link the Education building to the new Core Sciences building, the Core Sciences building to the parking garage structure and the parking garage structure to the Health Sciences Complex. Care should be taken to ensure the connection
at the Education Building is also accessible from street level. Please see Figure 40 and drawing SSK-16 in Appendix C for the suggested routing.

Figure 39: Pedestrian Tunnel - Morrissey Road @ Prince Philip Drive

Figure 40: Pedestrian Skywalks - Westerland Road Area

### 7.5 Crosswalk Design

### 7.5.1 Pavement Markings

The existing pavement markings at the crosswalks throughout campus fade every year, especially throughout the winter and need to be re-painted in the spring/summer. Pavement markings for crosswalks are crucial for allowing the vehicular traffic to identify the crosswalks and the adequate measures that need to be taken, such as stop bars and no passing lane.

A common application being used today, are Inlaid Thermoplastic Crosswalks. This application provides a high skid/slip resistance to ensure safety of pedestrians in slippery conditions, require low maintenance, and are snowplow friendly as the material sits slightly below the asphalt surface. Multiple patterns can be designed to allow for high visibility to both the pedestrian and traffic.

Figure 41: Inlaid Preformed Thermoplastic Crosswalks

### 7.5.2 Signage

All crosswalks will be clearly marked with the proper signage as indicated above in Section 7.1, as well as have adequate lighting to ensure visibility of the pedestrians. Each sign should have adequate retroreflectivity with the proper sheeting to guarantee 10 years. After the warrantee is surpassed, a reflectometer shall be used to determine if the sign needs to be replaced. Some examples of signs are shown below in Figure 42.

Figure 42: Typical Signage for Pedestrian Crosswalks

Crosswalk \& Pedestrian Safety

### 7.6 Crosswalk \& Pedestrian Safety Recommendations

### 7.6.1 Crosswalk Recommendations

The study team completed 8 pedestrian crossing control assessments and 14 crosswalk assessments throughout the MUN Campus. Based on the 8 pedestrian crossings, the following should be applied at the identified locations:
The following pedestrian crossings require the minimum of a ground mounted system with side mounted signs:

- Arctic Avenue/Kerwin Place
- Requires signage
- Westerland Road/Pedagogue's Close
- This intersection has been upgraded since the assessments were completed. This crossing now has curb extensions, proper signage and new push button RRFB system.
- Westerland Road/Lambe's Lane
- This intersection has been upgraded since the assessments were completed. This crossing now has curb extensions, proper signage and new push button RRFB system.
- Elizabeth Avenue/Newtown Road
- This intersection currently has an Overhead Flashing beacon as the pedestrian crossing control, which is adequate.
- Elizabeth Avenue/Rodney Street
- This intersection currently has an Overhead Flashing beacon as the pedestrian crossing control, which is adequate.
- Livyer's Loop
- Requires signage

The following pedestrian crossings require the minimum of a ground mounted system with an overhead mounted signs:

- Clinch Crescent/Bridge
- This crossing location requires the installation of the overhead mounted sign system.

The following pedestrian crossings require the minimum of an overhead flashing beacon system:

- Allandale Road/ Civic Address \#84/86
- This location currently has a half signal crossing and is adequate for this location.

The study team complete 14 crosswalk assessments and identified the deficiencies at each individual location. The following items should be addressed such as pavement markings, wheelchair accessibility, signage, stopping sight distance and street lighting.

## Crosswalk \& Pedestrian Safety

A common trend was that the pavement marking were barely visible and required re-painting as well as signage was missing at most of the pedestrian crossings. HTC recommends the following at all crosswalks throughout the MUN campus, not just the 22 that were assessed:

- Re-painting the zebra crosswalk markings (Inlaid Thermoplastic Crosswalks)
- WC-2 signs should be placed on each approach to pedestrian crossings
- Removal of red and/or amber flashing beacons
- All signage should be inspected for retro reflectivity

### 7.6.2 Curb Extension Recommendations

HTC reviewed the road network throughout the MUN campus and identified the locations where there is on-street parking and pedestrian crossings. There are 3 main roadways that have adjacent parking on the street and it is recommended that curb extensions be placed along the following roadways:

- Westerland Road
- Currently installed.
- Burton's Pond Road
- Phelan Road

## 8 Campus Specific Issues

### 8.1 Campus Master Plan/Assessment

In 2007 Memorial University released the Memorial University of Newfoundland St. John's Campus Master Plan (CMP). This chapter reviews the transportation recommendations from the CMP, discussing the recommendations that have been implemented, as well as those that remain to be addressed. Following this review is a commentary regarding the compatibility of the MUN Area Traffic Study to the CMP.

The CMP proposed a set of strategies to rationalize transportation access and circulation patterns within the Campus to foster a better balance between vehicular, transit and pedestrian movement between the Campus and the city of St. John's. The Master Plan is based on the premise that parking should not drive plans for expansion and modernization, and that a proactive approach to transportation improvements must be taken. Key transportation themes from the CMP have been derived from Sections 1.5 Campus Planning Principles (pg. 18 to 20), 1.6 Campus Community Consultation (pg. 22 to 24) and 2.2 Key Structuring Elements of Campus Development (pg. 38 to 52) of the CMP. These themes include:

1. The Campus should be welcoming and accessible and emphasize its setting in Pippy Park and the City of St. John's:
The Campus should be perceived as a year-round welcoming environment providing ease of orientation and clearly marked access to student and visitor services, recreational facilities and other community use facilities. Improved gateways should be considered to better mark one's arrival to the Campus through their presence at its edges.
The University's civic role and stewardship in the community also require that the campus edges positively interface with the surrounding community and Pippy Park. The setting, scale and design of new buildings, the development of outdoor spaces and circulation networks should be integrated with the surrounding community.
2. The Campus should be pedestrian-friendly and encourage a balance among transportation modes: Over time, the campus should rationalize vehicular accesses to limit opportunities for conflicts between pedestrians and vehicles, redesign parking lots to limit their visual impact, strengthen pedestrian routes and in general encourage transit and carpooling.
3. The Campus should be accessible to all:

All development and redevelopment on campus should seek to improve accessibility to students, staff, faculty and visitors with a broad range of disabilities. This includes barrier free access along pathways and to primary building entrances, 'desire lines' that cross parking and grassed areas, improved lighting and wayfinding, and the creation of clear, legible and continuous outdoor pedestrian networks.
4. The Campus transportation network should promote sustainability:

The University is committed to becoming a model of environmental responsibility through an enhanced focus on public transit, pedestrian and cycling facilities, compact development and residences and services within walking distance as a means for reducing automobile use both on

## 5. A Reconfigured Campus Road Network

Access to the Campus is primarily by private automobile. The road configuration on Campus promotes conflicts between pedestrians and vehicles, and access from public roads, particularly at the Prince Philip Drive intersections, resulting in congestion, stacking issues and occasional accidents.

The internal roadway system of the University should have the following characteristics:

- Low traffic volumes assisted by parking provisions provided at the perimeter of Campus;
- Clear, consistent wayfinding signage;
- Well-signed, visible pedestrian crossings identified by feature paving indicating pedestrian priority at all intersections;
- The ability to accommodate cyclists and parking at building entrances and where feasible, within buildings in dedicated security monitored areas;
- Low traffic speeds, reinforced by incorporating metered parking as a natural deterrent to speeding or other traffic calming measures if necessary;
- The provision of adequate bus stops and associated waiting areas throughout campus; and
- Well-lit, frequently located emergency call kiosks.

## 6. A Balanced Parking Strategy

Surface parking lots are dispersed in large and small lots throughout the University Campus with the larger lots typically adjacent the Campus perimeter roads, including Elizabeth Avenue, Prince Philip Drive and Westerland Road.

A key principle underlying the CMP's parking plan recommendations is that parking provisions should not be allowed to grow faster than the campus population. Parking provisions should not be solely based on need resulting from an increased campus population, but instead met through a variety of expanded opportunities, including transit, carpooling, walking and cycling to campus. The CMP focuses parking on the periphery of the Campus in a combination of below grade garages and a well-designed structured and surface parking.

相 1 HARBOURSIDE

## Campus Specific Issues

The items noted below identify the CMP transportation recommendations and status of implementation.

## Master Plan Direction

## Section 5.3 (Access and Circulation)

### 5.3.1 Sidewalk Design

To enhance pedestrian access and safety as well as snow storage, sidewalks in the range of 2.0 to 6.0 meters should be specified as campus streets are rebuilt.

Walkways:
The following is the recommended palette of materials and colours:

Primary Walkways (Major north-south, east-west connections):

- Minimum 6.0 m wide to accommodate emergency and service vehicles;
- High quality easily recognizable paving materials such as, unit pavers, natural stone, concrete paving;
- Unit pavers minimum 60 mm unit thick in areas of exclusive pedestrian use. Install on concrete base or use 70 mm to 80 mm thick pavers where paving will sustain vehicular use; and
- Specify textured surfaces to reduce slipping.

Secondary Walkways (Building to building connections):

- Minimum 3.0 m wide. High quality unit pavers.

Tertiary Walkways:

- Minimum 2.0 m wide;
- Unit pavers or natural concrete paving with broom finish;
- Location to be measured against overall plan; and
- Location to respond to path of desire.

## Streetscape Paving:

- Minimum 2.0 m wide high quality concrete paving, natural colour, broom finish. Areas of enhanced paving to be unit paving or natural local stone.
- Crosswalks to be paved with texturized, interlocking unit pavers.

Status: As roads are rebuilt the University should increase the minimum width of sidewalks to 2.0 meters with larger sidewalks located along primary roads with a set back from the curb.

Implementation Recommendations: Walkways should be implemented in the following hierarchy of priority:

- Primary Streets (Prince Philips Drive, Elizabeth Avenue, Westerland Road, Allandale Road and Arctic Avenue);
- Primary pedestrian walkways along Phelan Road and Livyer's Loop
- Secondary walkways between buildings; and
- Tertiary walkways.

Wherever unit pavers are prescribed a concrete sub-base is preferred. Asphalt or natural brushed concrete are alternatives.

### 5.3.2 Crosswalk Design

The CMP identifies the need to improve pedestrian crossings at intersections including clear pavement marking and signage, adequate lighting, as well as textured and coloured pavement at crossings to clearly signal these areas to both pedestrians and motorists.

The use of feature paving or where necessary the use of raised crosswalks should be considered to slow traffic and enhance pedestrian safety and security. These crosswalks should only be implemented on internal campus streets so that transit services are not negatively impacted.

Curb cuts should be included at all crossings, to promote universal accessibility with detectable warning plates.

Pedestrian call buttons at crosswalks should be located to be accessible even in periods of high snow accumulation. As the crosswalks are to be reconstructed to provide additional priority, the call buttons should be relocated to separate poles placed back from the road. This would also benefit users in wheelchairs throughout the year.

Status: Aside from curb cuts at most intersections none of these improvements have been implemented to date.

As part of the Traffic Area Study pedestrian counts were conducted at the following eight crosswalks:

1. Clinch Crescent/Bridge;
2. Arctic Avenue/Kerwin Place;
3. Westerland Road/Pedagogue's Close;
4. Westerland Road/Lambe's Lane;
5. Elizabeth Avenue/Newton Road;
6. Elizabeth Avenue/Rodney Street;
7. Livyer's Loop; and
8. Allandale Road/Civic Address \#84-86.

It was noted that three things were in common at each of the pedestrian crossings:

1. All crosswalks require replacing/ repainting;
2. WC-2 (Pedestrian Crossing Ahead signs) should be placed on each approach in advance to the pedestrian crossings to warn/advise the motorists of a crossing ahead; and

At the locations where there are yellow or red flashing beacons, they must be removed as they are not part of any code or regulation.

Implementation Recommendations: Improving crosswalks at the intersections with the highest pedestrian counts should take priority. As much as possible implementation should be conducted at the same time as road reconstruction.

### 5.3.3 Drop-off Areas:

A new drop-off and bus stop should be provided at the proposed east wing of the Arts and Science Building where an enclosed common and waiting area will be located. This should replace the existing transit stop at Elizabeth Avenue in front of the Arts and Administration Building. A formal drop-off area should be provided along the circular drive at the front entrance of the Arts and Administration Building.

The area at the Science Building and along Phelan Road should be reconfigured to provide a structured pick-up/drop-off area on the west side, immediately south of the Science parking access route. The Science Building permit parking in the quad should be controlled by an access gate to eliminate the problem of drivers blocking this access while waiting to pick people up.

A drop-off at the north east corner of the INCO Innovation Centre is proposed in conjunction with a limited amount of surface parking to the north at the eastern edge of Memorial Common.

A drop-off at Morrissey Drive at the north end of Long Common should be built.
Drop-offs to new buildings fronting Prince Philip Drive should be provided on Arctic Avenue to the north and Pedagogues Close Extension to the south.

Drop-offs to the new residences west and east of Burton's Pond should be located at the north end of each building along Livyer's Loop and Burton's Pond Road.

Implementation Recommendations: As new buildings are constructed, or existing buildings undergo renovations, drop off areas should be considered as part of site design and built form.

Drop off areas should prioritize barrier free accessibility, weather protection and minimizing walking distance. Traffic flow and the potential conflicts with pedestrians should be considered when selecting the location of drop off areas.

### 5.3.4 Dedicated right turn lanes

The dedicated (channelized) right turn lanes on Elizabeth Avenue at Westerland Road and Allandale Road should be removed when reconstruction occurs to slow down traffic and provide a more pedestrianfriendly environment.

Status: This recommendation has yet to be implemented.

## Campus Edges: Prince Philip Drive

Prince Philip Drive is to be transformed as a landscaped 'parkway' with banner poles and other site furnishings to animate the space.

Status: Street trees, banner poles and site furnishings have not been installed.

A 'green bridge' should be built to extend pedestrian access between new buildings across the Parkway, provide common university space and provide a new landmark gateway structure.

Status: No new pedestrian bridges have been built across Prince Philip Drive since the completion of the CMP.

The chain link barrier is to be replaced by a centre raised median of planted majestic columnar oaks that retain their leaves in winter. The edges of the parkway should allow for cyclists and pedestrians to travel safely within the boulevard between a double row of trees on both the north and south sides of the street.

Status: The chain link barrier has not yet been replaced. Trees have not been planted and the existing 1.8 meter sidewalk widths are too narrow.

Implementation Recommendations: Banners poles and other site furnishings for Prince Philip Drive and other campus roads should be installed as part of an overall streetscape strategy for the University.

Streetscape upgrades for Prince Philip Drive should be built as per the proposed plan and section identified on page 104 of the CMP and shown in Figure 43.

Figure 43: Prince Philip Drive, proposed plan and section from the CMP

## Campus Edges: Elizabeth Avenue

Elizabeth Avenue is a residential street that borders the campus along its south side. The broad boulevard on the campus side provides opportunities to enhance the campus image by intensifying the planting and improving the streetscape with a double row of trees and installation of new site furnishings, including university banners, pedestrian-scaled lighting and feature paving.

Status: The University has yet to plant a double row of trees and new site furnishings, including university banners, pedestrian-scaled lighting and feature paving have not been installed.

A widening of Elizabeth Avenue at the University Edge would not only be detrimental to the character of this important gateway to the Campus and walkability along its southern edge, but could create excess
capacity. This would likely attract more demand, potentially involving more traffic infiltration through campus, resulting in a future congestion level that would prompt a need for further road improvements.

Status: To date Elizabeth Avenue has not been widened. The CMP recommendation remains to review alternative options to improving vehicle movement without expanding the width of the roadway.
Prior to proceeding with a widening, it was recommended that the City undertake a broad update of the needs for Elizabeth Avenue, based on updated travel demand forecasts, on an option for a three-lane crosssection. The third turning lane would provide improved storage for vehicles turning at Westerland Road, Russell Road and the proposed north-south road to the western edge of Campus.

The large 10 to 20 meter setback at Elizabeth Avenue should be landscaped to buffer existing and realigned surface parking areas.

Status: The setback has not been landscaped.
Implementation Recommendations: At the very least a double set of trees should be installed on the north side of Elizabeth Avenue. Changes should be designed in concert with the new cross-section.

Streetscape upgrades for Elizabeth Avenue should be built as per the proposed plan and section identified on page 101 of the CMP and shown in Figure 44.

Figure 44: Elizabeth Avenue, proposed plan and section from the CMP

## Campus Edges: Westerland Road

Westerland Road is a wide, open roadway surrounded by large scale buildings and parking areas. The CMP proposes to improve the aesthetics and scale of the pedestrian experience by installing sidewalks on both sides and planting a double row of street trees.

Status: South of the Aquarena sidewalks are located along both sides of Westerland Road south of the Aquarena. North of the Aquarena sidewalks are only located along the eastern boulevard of Westerland Road. A double row of street trees have not been planted along Westerland Road.

Implementation Recommendations: Sidewalks should be installed along the western boulevard of Westerland Road. Changes in concert with long term concepts.

Streetscape upgrades for Westerland Road should be built as per the proposed plan and section identified on page 102 of the CMP as shown in Figure 45.

Figure 45: Westerland Road, proposed plan and section from the CMP

## Campus Edges: Allandale Road

Allandale Road is a residential street that borders the campus along its east side. Although residential in nature, Allandale sustains heavy traffic and would benefit from intensified planting and improvements to the streetscape, such as a double row of trees and the installation of new site furnishings.

Status: Improvements, including a double row of trees and the installation of new site furnishings have not been installed.

Implementation Recommendations: Streetscape upgrades for Allandale Road should be built as per the proposed plan and section identified on page 103 of the CMP as shown in Figure 45.

Figure 46: Allandale Road, proposed plan and section from the CMP

## Boulevard Design: Prince Philip Drive

As indicated within the proposed plan and section on page 104 of the CMP (Figure 43), Prince Philip Drive has a 28.5 m right-of-way (ROW).

From north to south, this ROW includes a:

- Row of street trees;
- 2.0 meter pedestrian clearway (sidewalk);
- Row of street trees within a 1.5 to 3.0 meter landscaped buffer
- 3.5 meter travel lane
- 3.5 meter travel lane;
- 4.5 meter landscaped median;
- 3.5 meter travel lane;
- 3.5 meter travel lane;

## Campus Specific Issues

- Row of street trees within a 1.5 to 3.0 meter landscaped buffer
- 2.0 meter pedestrian clearway; and
- Row of street trees

Street furniture including seating and banner poles are to be located within the double row of trees.
Implementation Recommendations: Prince Philip Drive should be reconstructed to the proposed section and plan within the timeline identified within the University's Capital Plan in concert with the roundabouts and transit terminal.

## Boulevard Design: Elizabeth Avenue

As indicated within the proposed plan and section on page 101 of the CMP (Figure 44), Elizabeth Avenue has a 17.0 m ROW.

From north to south, this ROW includes a:

- Row of street trees;
- 2.0 meter pedestrian clearway (sidewalk);
- Row of street trees within a 3.0 meter landscaped buffer
- 3.5 meter travel lane
- 3.5 meter travel lane;
- Row of street trees within a 3.0 meter landscaped buffer
- 2.0 meter pedestrian clearway; and
- Row of street trees

Street furniture including seating and banner poles are to be located within the double row of trees.
Implementation Recommendations: Elizabeth Avenue should be reconstructed to the proposed section and plan within the timeline identified within the University's Capital Plan in concert with long term concept.

## Boulevard Design: Westerland Road

As indicated within the proposed plan and section on page 102 of the CMP (Figure 45), Westerland Road has a 17.0 m ROW.

From east to west, this ROW includes a:

- Row of street trees;
- 2.0 meter pedestrian clearway (sidewalk);
- Row of street trees within a 3.0 meter landscaped buffer
- 3.5 meter travel lane
- 3.5 meter travel lane;
- Row of street trees within a 3.0 meter landscaped buffer
- 2.0 meter pedestrian clearway; and
- Row of street trees

Street furniture including seating and banner poles are to be located within the double row of trees.

Campus Specific Issues
Implementation Recommendations: Westerland Road should be reconstructed to the proposed section and plan within the timeline identified within the University's Capital Plan in concert with long term concept.

## Boulevard Design: Allandale Road

As indicated within the proposed plan and section on page 103 of the CMP (Figure 46), Allandale Road is proposed to have the following cross section

From east to west:

- Row of street trees;
- 2.0 meter pedestrian clearway (sidewalk);
- Row of street trees within a 3.0 meter landscaped buffer
- 3.5 meter travel lane
- 3.5 meter travel lane; and
- Residential property

Street furniture including seating and banner poles are to be located within the double row of trees.
Implementation Recommendations: Allandale Road should be reconstructed to the proposed section and plan within the timeline identified within the University's Capital Plan in concert with short term roundabout and new lanes.

## Gateway Markers

Gateway markers are designed to signal arrival at key intersections.
Primary Gateway were identified for the intersections of Prince Philip Drive and Westerland Road and Prince Philip Drive and Allandale Road.

Secondary Gateway Markers were identified for:

- Elizabeth Avenue and Westerland Road;
- Elizabeth Avenue; and
- Elizabeth Avenue and Allandale Road (see Figure 4.2: Edges and Gateways, page 139 of the CMP).

Status: At the Prince Philip Drive and Westerland Road intersection a small gateway marker exists adjacent to the G.A. Hickman Building.

No gateway markers exist at the Prince Philip Drive and Allandale Road, Elizabeth Avenue and Allandale Road, and Elizabeth Avenue and Westerland Road intersections.

Implementation Recommendations: Page 137 of the CMP provides examples of potential gateway features and the centre island of a roundabout could also be used as a gateway.

A more prominent gateway marker should be installed to announce the entrance to the University. The CMP envisions a vertical wind turbine in combination with a landscape feature to mark this location (CMP page 136).

### 5.3.5 Improvements to the Westerland Road / Clinch Crescent Area

Pedestrian connections along Westerland Road / Clinch Crescent between the Aquarena / Field House and the parking facilities north of Prince Philip Drive (and leading to the Hospital) should be improved. As part of any future developments along this route, consideration should be given to integrating another elevated walkway across Prince Philip.

In addition, shelter for pedestrians from the 'horizontal rain' and wind is recommended along Westerland Road and Clinch Crescent. This protection may take the form of colonnaded buildings, potentially combined with plantings or other windbreak installations.

Status: None of these improvements have yet to be implemented.
Implementation Recommendations: As new buildings are constructed, or existing buildings undergo renovations, shelter from the elements, including a potential elevated walkway, should be considered as part of site design and built form.

Pedestrian connections should prioritize barrier free accessibility, weather protection and minimizing walking distance.

### 5.3.6 Russell Road Area

To improve access and safety, facilitate traffic operations on Elizabeth Avenue and establish a gateway into the campus, Russell Road should be reconfigured to align with Phelan Road to the north and Rodney Street to the south. In addition, exclusive left turn lanes should be provided at the Elizabeth / Russell intersection.

Status: These recommendations have yet to be implemented.

Implementation Recommendations: This is to be completed as part of Elizabeth Avenue upgrades.

### 5.3.7 Intersection of Livyer's Loop / Morrissey Road at Prince Philip Drive

At the intersection of Livyer's Loop / Morrissey Road at Prince Philip Drive, a widening is recommended to improve safety impacts due to the overlapping southbound and northbound left turns.

Status: The northbound left turn lane from Prince Philip Drive has been removed at this location. Please note that in Section 4.1, the recommendations supersede this.

### 5.3.8 Intersection of Irwin's Road / Livyer's Loop at Prince Philip Drive

The Irwin's Road / Livyer's Loop intersection is extremely close to Prince Philip Drive. It is recommended that Irwin's Road be realigned south at this location to clearly separate the two intersections and provide more space for pedestrians at the intersection.

Status: This recommendation has yet to be implemented and this intersection has been recommended to be removed in the long term.

### 5.3.9 Morrissey Road

To optimize traffic flow in the north east quadrant of campus, Morrissey Road should be separated from the parking lots as much as possible.

It is recommended that the break in the median on Prince Philip be closed and the existing access be relocated to the east.

A new signalized intersection was recommended midway between Morrissey Road / Livyer's Loop and Allandale Road. This intersection would accommodate development in the northeast quadrant of campus and facilitate pedestrian crossings of Prince Philip Drive. A two-phase pedestrian-activated traffic signal would be installed, with an elevated enclosed crosswalk as an alternative.

The eastern arm of Morrissey Road is extended directly south to connect with Prince Philip Drive and replaces the intersection directly to the east, reducing traffic circulation in front of the Colleges.

Status: These recommendations have yet to be implemented.

Implementation Recommendation: Reconstruction of Prince Philip Drive is a priority of the CMP. Reconstruction of Prince Philip Drive should take into consideration the recommendations for Morrissey Drive to ensure that future changes to this road are not compromised.

### 5.3.11 Livyer's Loop

Operate Livyer's Loop as one-way either clockwise or counter-clockwise between the Livyer's Loop / Irwin's Road intersection and the Phelan Road intersection. The north-south section between Phelan Road /Russell Road and Prince Philip Drive would remain two-way. This would simplify operations and enhance safety at the Prince Philip intersection. The easterly access onto Prince Philip Drive should at least be redesigned to restrict eastbound right turns into campus, to avoid an unsafe situation. A preferred option would be to close this access, as it does not conform to acceptable design standards.

Status: This recommendation has been implemented. Livyer's Loop between Irwins' Road and the Phelan Road intersection is operating as a one-way street in a counter-clockwise direction.

## Pedagogue Close

Pedagogue Close is to be extended north to connect with Irwin's Road directly east of the Education Building, eliminating the section of Irwin's Road that extends in front of the Education Building and connects to Westerland Road.

Status: The recommendations have not been implemented. Pedagogue's close ends in a cul-de-sac directly north of the Education Building.

Implementation Recommendation: This is to be completed as part of short term roundabout at Clinch Crescent and Westerland Road.

## Arctic Avenue

Arctic Avenue is to be redefined by new buildings fronting on both sides.
Status: New buildings have not been built yet along Arctic Avenue. Over time this recommendation will be implemented.

## Clinch Crescent

Clinch Crescent remains in its current configuration, but is landscaped and 'greened' as an important entry road to the Health Sciences Centre Complex, Mt. Scio Road and the landscape beyond.

Status: This recommendation has not been implemented.

## Master Plan Direction <br> Section 5.4 (Parking)

### 5.4.3 Surface Parking Areas:

Parking lots should be screened with intensive groundcover, shrubs and tree planting to minimize their visual impact. Healthy existing trees near or within parking areas should be preserved. All opportunities to plant evergreen plant material along the perimeter of parking areas or within internal islands should be pursued.

Surface materials should be selected to support the nature of the pedestrian oriented campus. Although making a clear distinction between pedestrian and vehicular areas is an important issue, parking lot surfaces should blend well with surrounding pedestrian spaces. Surface materials such as unit pavers may be a preferable alternative to large expanses of asphalt. Combinations of materials, such as concrete with unit paving banding or unit paving with natural stone can also be considered.

Status: Surface parking presently comprises a significant component of Campus land and is visually intrusive with a lack of vegetative buffer.

Implementation Recommendations: As peripheral roads are rebuilt they should incorporate vegetation to screen adjacent surface parking lots and to contribute to the theme of a Campus within a park.

### 5.4.3 Structured Parking:

Two potential locations for structured parking were recommended.

The first location was identified on top of parking lot \#27 located on the north side of campus in front of the Utilities Annex. This was intended to be a four level structure totaling 752 parking spaces.

Status: This parking structure has been constructed as recommended in the CMP.
The second proposed garage was recommended to be located behind the Aquarena. This proposed garage would be on four levels, with a total of 480 parking spaces.

Status: The second proposed garage has not been constructed.

### 5.4.3 Below Grade Parking:

Two below grade parking structures for buildings located on the north side or Prince Philip Drive, west of the University Centre was recommended. These buildings were identified as each having 96 parking spaces totaling 192 new spaces.

A third parking structure was proposed to be located below a proposed new academic building just north of the Library and would contain 60 new spaces.

A second set of below grade parking structures was recommended to be included in the proposed Residence and Residence / Academic Building in the North East Campus, split between the two buildings. Each building would contain 60 below grade spaces, totaling 120 new parking spaces.

Status: These recommendations have not been implemented.

Implementation Recommendations: As new buildings are constructed below grade parking should take advantage of the grade changes on campus and be considered as part of site design and built form.

### 5.4.4 Pricing Structure:

The CMP recommended raising parking fees for all lots with the exception of some parking for car pool users to encourage people to carpool.

The CMP recommended that parking fee increases be introduced in a phased manner over a five year period.

Status: The overall cost of parking on Campus is well below what would be considered a reasonable market rate and should be increased to encourage alternative modes of transport.

Implementation Recommendations: Campus collective agreements make it very difficult to raise rates. A key policy recommendation from the Traffic Area Study is for Memorial University to completely separate parking from their collective agreements. In doing so, they will be able to increase rates, influence transportation choice and limit the risk associated with taxable benefits

## Master Plan Direction Section 5.5 (Planning for Alternatives)

### 5.5.1 Transportation Management Association (TMA)

Promote the formation of a TMA with other large area employers such as the Hospital System and the provincial government. The TMA should meet regularly with the City and collectively plan for transportation in a holistic fashion, recognizing that all modes are tied to one another and related to metropolitan planning decisions.

Status: Requires verification

### 5.5.1 Transportation Demand Management (TDM)

A TDM strategy should be developed to minimize travel by single occupant vehicles, requiring that transportation would be managed holistically at the University. This should include regular monitoring of progress towards sustainability.

Status: A formal TDM strategy is required for the University.

Implementation Recommendations: Many of the recommendations from the CMP and Traffic Area Study should form key elements of the TDM strategy. Chapter 6 of the Traffic Area Study provides further detail on the requirements for a formal TDM strategy.

### 5.5.2 Transit Signage and Wayfinding

Collaboration with Metrobus would improve the public transit provider's presence on campus. Information kiosks at all transit stops that provide schedule and route information should be installed.

Status: Since the release of the CMP, advances in smartphone technology have changed the primary manner in which transit route information is shared such that while information kiosks have not been built at all transit stops the intent of this recommendation has largely been met.

Metrobus presently provides a number of customer conveniences to assist with travel including Google Transit Trip Planner, interactive root maps, text alerts on bus arrivals, printed route maps and schedules, electronic fare payment and the AIR MILES loyalty program.

Implementation Recommendations: Metrobus should investigate the installation of interactive electronic screen displays in major transit points, malls and transit terminals displaying transit route and real-time transit information and transit trip planning capability.

### 5.5.3 Campus Design for Transit

Installation of traffic signals at the intersection of Clinch Crescent and Arctic Avenue would improve future traffic operations and permit introduction of transit priority signaling.

Status: Traffic signals have not been installed at the intersection of Clinch Crescent and Arctic Avenue.

Proper signage and high quality pavement markings (preferably unit pavers installed with a proper base) also need to be implemented for the transit station on Arctic Avenue at the University Centre, so that traffic will respect the priority of the buses. In the longer term, as transit use grows, the space may need to be reconfigured to create two separate lanes for buses, with appropriate shelters and sidewalks.

Status: The recommendations have not been implemented.

Over the longer term, consideration should be given to make Arctic Avenue a transit priority corridor. At Clinch Crescent, a queue jump lane for buses turning left should be considered.

Status: The recommendations have not yet been implemented.
The CMP includes a new road parallel to Westerland Road, west of the Aquarena. This presents an opportunity to separate transit vehicles from the general traffic stream, to further prioritize transit. At the intersection of Elizabeth Avenue and Westerland Road, the eastbound left turns should be restricted to buses only. Cars would be redirected to the new route road parallel to Westerland Road, extending between Prince Philip Drive and Elizabeth Avenue.

Status: The CMP recommendations have not been implemented.
A new bus stop and shelter along Elizabeth Avenue are also recommended to improve transit access on the south side of campus adjacent to the existing and proposed residences. The location would be adjacent to the Arts and Administration Building. This would require buses to enter campus via the reconfigured central access driveway.

Status: A bus layby, bus stop and shelter has been built along Elizabeth Avenue, south of the Arts and Administration Building.

### 5.7 Cycling

A staged evolution to increased cycling was recommended, as follows:

As a first step, replace the existing bike racks with a design that provides adequate support for bicycles. The ring and post style (Figure 47) is widely used and favoured by cyclists and facilitates snow removal. The bike racks should as a minimum to replace the existing capacity. Additional bike parking should be introduced outside every building, in a minimal initial number such as five to ten spaces.

Status: Requires verification.

Figure 47: Ring \& Post style bike racks

Introduce bike parking inside new structured parking facilities. Using one weather-protected parking space for bike parking as a starting point will further encourage bike use. Create indoor bike parking in buildings where there is available space. Clearly defined areas designated for bicycle parking can provide shelter from harsh weather, as well as increased security of parked bicycles.

Status: Requires verification.

Assuming that bike use continues to expand, the University should work with the City to plan for enhanced bike security on well-used bike routes to campus. These can take the form of painting travel lanes as 'shared lanes' with a bicycle symbol, or if space permits, restriping existing roads to provide reserved lanes. In the case of road widening, work with the City to introduce bike lanes where feasible and indicated by demand.

Status: These recommendations have yet to be implemented.

As part of future developments, the University should consider providing secure in-building bicycle storage and changing / shower facilities to further encourage cycling.

Status: Requires verification.

The recommendations outlined above anticipate that changes to the campus transportation network will occur over time as the campus builds out. Open space and public space requirements should be seen as priorities that are directly tied to the transportation network. Prince Philip Drive, Elizabeth Avenue, Allandale Road and Westerland Road must capitalize on the opportunity for them to serve more than a
strictly transportation function, emphasizing their placemaking role as welcoming entrances to a campus within a park. We recommend the four most critical projects for implementation to include (1) raising the cost of parking to reflect market rates; (2) reconstruction of Prince Philip Drive and (3) Elizabeth Avenue to reflect the preferred CMP cross-sections, including boulevard space to accommodate snow loads; and (4) an open space network that seamlessly integrates cycling, pedestrian and transit connections.

### 8.2 MUN Area Traffic Study

The findings from the MUN Area Traffic Study (Traffic Study) are generally consistent with the goals of the CMP. The relationship between key recommendations from the Traffic Study and the CMP are as follows:

### 8.2.1 Elizabeth Avenue

Level of Service results from the 1998 St. John's Transportation Study show that existing conditions along Elizabeth Avenue/Westerland and Elizabeth/Bonaventure operate at failing level of service (F). To mitigate this measure, the study recommended widening the corridor to four lanes and providing turning lanes at the intersections. The Scenario 0 results completed by HTC for the MUN Traffic Study showed conditions that are somewhat better than those noted in the 1998 St. John's Transportation Study. Please refer to Section 2.1.1 for details in this regard.

The CMP suggested that the widening of Elizabeth Avenue at the University edge would not only be detrimental to the character of the campus gateway but could create excess capacity. It was recommended that, prior to proceeding with any widening, the City should undertake a broad update of the needs for Elizabeth Avenue, based on updated travel demand forecasts and an option for a three-lane cross section. The Traffic Study recognizes that Elizabeth Avenue needs to serve a number of functions, including providing alternate access to the campus and creating a safe, efficient route for pedestrians and cyclists. The intersections must operate safely and efficiently and the roadway should balance the needs of all users and promote a campus setting.

To address these issues, the Traffic Study proposed a roundabout corridor in the long term and traversable median. While not a direct recommendation from the CMP, this concept is consistent with the goals of the master plan. This option is worth considering as it provides the ability for the corridor to accommodate greater levels of traffic without the need to widen the street.

### 8.2.2 Prince Philip Drive / Morrissey Road / Irwin's Road and Livyer's Loop

The Traffic Study recommends a reconfiguration of the road network within this general area. The reconfiguration involves closing the intersection of Morrissey Road and Prince Philip Drive. The segment of Morrissey Road between Arctic Avenue and Prince Philip Drive would be removed and the median on Prince Philip Drive would be closed and fenced to prevent pedestrian crossing. Traffic on Arctic Avenue would be re-routed left onto Morrissey Road and eventually to a new roadway extending from Morrissey Road to the east intersection of Livyer's Loop with Prince Philip Drive. A roundabout would then be installed at this location. The Traffic Area Study also recommends a new pedestrian tunnel be installed in line with the east side of Livyer's Loop. The median on Prince Philip Drive would be fenced at this location to prevent further pedestrian crossings.

As stated in the table above, the CMP recommends that the intersection of Livyer's Loop / Morrissey Road at Prince Philip Drive be widened to improve safety impacts due to the overlapping southbound and northbound left turns. As the Irwin's Road / Livyer's Loop intersection is extremely close to Prince Philip Drive, the CMP recommends that Irwin's Road be realigned south at this location to clearly separate the two intersections and provide more space for pedestrians. As well, consistent with the Traffic Study, the CMP recommends that the eastern arm of Morrissey Drive be extended directly south to connect with Prince Philip Drive. Similar to the Traffic Study, the intent of these recommendations is to improve circulation and reduce conflicts between pedestrians and vehicles. However, to be consistent with the CMP, the median on Prince Philip Drive should only be fenced as an interim solution with the long term goal being the installation of a 4.5 meter landscaped median.

### 8.2.3 Westerland Road

The long term Traffic Study recommendation is to relocate Westerland Road to the west, effectively moving the road from the interior of campus to its periphery, west of any on-campus parking. The existing Westerland Road would be closed completely to through-traffic. This major change would create the conditions for a pedestrian-friendly corridor within the existing Westerland Road right-of-way.

The recommendation to close Westerland Road to through-traffic and repurpose it as a pedestrian-friendly corridor exceeds the CMP recommendations for Westerland Road. However, this move is consistent with the CMP Planning Principles that the campus should be pedestrian-friendly, encourage a balance between transportation modes and minimize conflicts between pedestrians and vehicles. Therefore, relocating Westerland Road and converting the existing street to a pedestrian friendly corridor is fully supported by the CMP. Under this scenario, Westerland Road should be resurfaced using high quality, distinctive paving materials such as unit pavers, natural stone and concrete paving. Street trees with deep soil cells should also be planted.

### 8.2.4 Costs of Parking on Campus

There is a strong relationship between parking availability, parking rates and travel mode choice. Both the CMP and Traffic Area Study recognize that parking on campus is well below what would be considered a reasonable market rate. Memorial University needs to completely separate parking from their collective agreements in order to increase rates and promote more sustainable transportation choices.

Overall there is a strong compatibility between the Campus Master Plan and the MUN Area Traffic Study. Adoption of the above mentioned Traffic Study recommendations will advance the goals and objectives of the CMP.

Conclusions, Recommendation \& Costs

## 9 Conclusions, Recommendations \& Costs

## Detailed Traffic Analysis

The City of St. John's, in their review of the high level analysis results raised concerns that the 2025 AM and PM peak hour VISUM models, that were provided by the City of St. John's and used by Harbourside Transportation Consultants (HTC) in the high level analysis work for this study, appeared to be over representing the expected forecasted traffic volumes for 2025.

As a result of these concerns the City of St. John's and Hatch Mott MacDonald decided to conduct a detailed analysis of 6 study area intersections using existing traffic volumes that were both factored and adjusted by an agreed amount to reflect anticipated growth and the redistribution of traffic patterns expected to occur with the completion of the Team Gushue Highway. These volumes were prepared by Hatch Mott MacDonald, approved by the City of St. John's and provided to HTC to complete the detailed traffic analysis.

It was agreed that the high level analysis results would be used to highlight, conceptually, the improvements that would be required at some point in the future within the Study Area. These improvements would be used for planning purposes but would be reaffirmed in a more comprehensive Transportation Planning exercise that is planned by the City of St. John's as they update their Transportation Plan in the near future. The detailed analysis results would be used to plan capital improvements that are required at the key intersections within the study area within the next 5 years.

The study area for this detailed analysis included six intersections; three on Prince Philip Drive and three on Elizabeth Avenue near Memorial University. The six intersections that were analyzed included:

- Prince Philip Drive/Columbus Drive \& Thorburn Road
- Prince Philip Drive \& Clinch Crescent/Westerland Road
- Prince Philip Drive \& Allandale Road
- Elizabeth Avenue \& Allandale Road/Bonaventure Avenue
- Elizabeth Avenue \& Westerland Road
- Elizabeth Avenue \& Freshwater Road

## Findings / Recommendations - Detailed Traffic Analysis

Prince Philip Drive/Columbus Drive \& Thorburn Road
The intersection of Prince Philip Drive and Thorburn Road is one of the largest most complex intersections that the City of St. John's controls. This intersection already has three through lanes in both the north and southbound directions and a dual left turning lane on Thorburn Road. The results of our analysis indicates that little or nothing can be done with the present method of traffic control at this intersection in terms of signal timing, phasing, cycle length changes or with auxiliary lane additions that will provide an acceptable level of service at this intersection in either of the analysis periods for 2025. Our analysis using a multi-lane roundabout as the method of traffic control yielded acceptable results in terms of the LOS during both analysis periods.

## Conclusions, Recommendation \& Costs

Accordingly our recommendation, is to reconfigure the intersection to a multi-lane roundabout as shown in Figure 7.

## Prince Philip Drive \& Clinch Crescent / Westerland Road

The intersection of Prince Philip Drive and Clinch Crescent/Westerland Road is also a major intersection for the City of St. John's. It provides a secondary access to the Health Sciences complex from Prince Philip Drive and provides both vehicular and pedestrian connections to both sides of campus. The result of our analysis, again, indicate that little or nothing can be done with the present method of traffic control at this intersection in terms of signal timing, phasing, cycle length changes or with auxiliary lane additions that will provide an acceptable level of service at this intersection in either of the analysis periods for 2025. Our analysis using a multi-lane roundabout as the method of traffic control yielded acceptable results in terms of the LOS during both analysis periods. Our recommendation is to reconfigure this intersection to a multi-lane roundabout as shown in Figure 8.

HTC would also like to point out that this design does not match with the overall concept plan developed for this area of the study. This intersection was configured as a 3-way roundabout with Westerland Road being closed to through traffic. This being done to address the public input HTC had received and concerns in relation to pedestrian safety.

## Prince Philip Drive \& Allandale Road

The intersection of Prince Philip Drive and Allandale is again a very large, somewhat complicated signalized intersection with heavy traffic flows on most approaches of the intersection. This intersection also has a high collision rate - 98 traffic collisions over a 3 year period. The results of our analysis, again, indicate that little or nothing can be done with the present method of traffic control at this intersection in terms of signal timing, phasing, and cycle length changes or with auxiliary lane additions that will provide an acceptable level of service at this intersection in either of the analysis periods for 2025. Our analysis using a multi-lane roundabout as the method of traffic control yielded acceptable results in terms of the LOS during both analysis periods. Our recommendation is to reconfigure this intersection to a multi-lane roundabout. HTC added a right turn by-lass lane on the northwest side of the roundabout to accommodate the heavy right turn volume sat this location. Figure 9 shows the concept for the roundabout.

## Elizabeth Avenue \& Allandale Road / Bonaventure Avenue

The intersection of Elizabeth Avenue and Allandale is also a busy signalized intersection located at the eastern boundary of the study area. The results of our analysis indicate that the traffic volumes projected or forecasted to be present at this intersection can work under a signalized intersection control configuration. Some timing changes and some geometric lane improvements will be necessary. Based on this conceptual plan shown in Figure 10, HTC are estimating the cost of the proposed geometric changes to this intersection will be approximately $\$ 200,000$.

## Conclusions, Recommendation \& Costs

## Elizabeth Avenue \& Westerland Road

The Elizabeth Avenue intersection with Westerland Road is one of the smaller intersections included within this detailed analysis. Our analysis of the 2025 peak hour volumes indicates that an acceptable LOS can be achieved with a minor geometric improvements (the addition of an auxiliary right turn lane in the westbound direction) and some timing changes to the controller. The estimated cost based on the conceptual design shown in Figure 11 is estimated at $\$ 150,000$.

Again, HTC would also like to point out that this design does not match the overall concept plan that was developed for the Elizabeth Avenue area of the study. Under that concept plan this intersection was removed totally from the network in this area.

## Elizabeth Avenue \& Freshwater Road

The analysis work completed by HTC at the intersection of Elizabeth Avenue Road and Freshwater Road shows that this intersection functions well during the both analysis periods of 2025.

It should be noted that traffic currently spills back during both peak periods from the Oxen Pond Intersection with Freshwater and affects the operation at Freshwater Road and Elizabeth Avenue. So, while the detailed analysis shows a good level of service, things are likely to be much worse because of the operational problems at the Freshwater Road intersection with Oxen Pond Road.

The results of this detailed analysis clearly indicate that the three intersections along Prince Philip Drive will be over capacity by the year 2025 in both analysis periods. The recommendations are largely the same as those that had been identified as being required in the high level analysis.

It should be noted that while only minor improvements are suggested along Elizabeth Avenue at the high level analysis area intersections, the volumes are not significantly different than those used in the original analysis. Single lane volumes of 650-850 vehicles per hour, do not leave much spare capacity for unanticipated or expected growth in volumes. Much of the public feedback on this project, indicates that pedestrian safety is a major concern along Westerland Road and hence the comments and concepts that were developed in section 4.2 of report still apply. HTC remains of the opinion that the segment of Westerland Road from Prince Philip Drive to Elizabeth Avenue should be removed from service altogether.

HTC also heard during the public consultation process that that many people, including the administration of the campus, did not want to see any widening of Elizabeth Avenue. This was a significant influencing factor in our rationale to provide a roundabout corridor along Elizabeth Avenue. HTC are able to handle the traffic flows without any widening. A raised median in the centre of Elizabeth Avenue and an AT trail along the north side of the road was also provided. In HTC's opinion, maintaining a conventional corridor of traffic signals will not facilitate that vision.

Conclusions, Recommendation \& Costs
Table 16: Detailed Analysis Cost

| Detailed Analysis |  |  |
| :---: | :---: | :---: |
| Priority |  |  |
| 1 Prince Philip Drive \& Allandale Road | \$ | 1,600,000 |
| 2 Prince Philip Drive \& Clinch Crescent/Westerland Road | \$ | 1,200,000 |
| Prince Philip Drive/Columbus Drive \& Thorburn Road | \$ | 1,800,000 |
| 4 Elizabeth Avenue \& Allandale Road/Bonaventure Avenue | \$ | 200,000 |
| 4 Elizabeth Avenue \& Westerland Road | \$ | 150,000 |
| Total Cost of Detailed Analysis | \$ | 50,000 |

## High Level Traffic Analysis

The high level traffic analysis for this study was completed by the study team using a number of different software packages including VISUM, Synchro/ SimTraffic (V9) and ARCADY/ Junctions 8. The analysis included an AM and PM peak hour review of the following 5 scenarios:

- Scenario 1: 2025 Projection of normal growth with no new development in the study area.
- Scenario 2: 2025 Projection of normal growth with no new development in the study area with improvements to the road network such as auxiliary lanes, and/or intersection signal timing/phasing improvements.
- Scenario 3: 2025 Projection of normal growth with new development in the study area with improvements to the road network such as auxiliary lanes, and/or intersection signal timing/phasing improvements.
- Scenario 4: 2025 Projection of normal growth with new development in the study area with improvements to the road network (such as auxiliary lanes, signal timing improvements or phasing). This scenario also includes the widening of Elizabeth Avenue and a proposed link from the Allandale Road Interchange with the Outer Ring Road and Clinch Crescent.

HTC also added an additional scenario 4B that was evaluated to consider roundabouts as an alternative to signal controls in the road network.

## Findings - High Level Analysis

Scenario S1 is a year 2025 projection of the traffic volumes expected to be present on the study area road network under existing intersection timing/phasing and lane configurations in both the AM and PM peak periods of day. During the PM peak hour, under the volumes for the Scenario (S1), most of the intersections in the study area suffer from poor levels of service and congestion. Even with minor improvements to signal timings/phasing and lane configurations where appropriate, as modelled under Scenario (S2), there is little improvement in levels of service and congestion throughout the study area road network. LOS conditions under Scenario (S3), the campus study area growth scenario, are slightly better because of improvements put in place at the Elizabeth Avenue intersection with Freshwater Road, but overall many intersections throughout the study area still suffer from poor levels of service and congestion and more predominately so during the PM peak hour.

## Conclusions, Recommendation \& Costs

Under Scenario (S4) Option A traffic volumes are again projected to the year 2025, growth is considered, and several significant changes are made to the MUN area road network including the addition of a new link from the intersection of Mt. Scio Road/Allandale Road to Clinch Crescent and the widening of Elizabeth Avenue to two through lanes in each direction from Allandale Road to Freshwater Road and Stamp's Lane. The results of the LOS analysis for Scenario (S4) Option A in the PM peak hour indicate some improvements in the LOS for some study area intersections when compared to the LOS results for Scenario (S3), 6 of the study areas 20 intersections show an improvement.

The new roadway connecting the intersection of Mt. Scio Road and Allandale Road to Clinch Crescent is expected to draw an average daily traffic volume of 18,500 vpd. The PM peak hour volumes are the heaviest, with 1,450 in the NB direction and 925 in the SB direction. This new roadway in combination with the additional lanes on Elizabeth Avenue reduce the overall traffic volumes on segments of Prince Philip Drive and Allandale Road, but the relief, while significant and needed, is not sufficient enough itself to reestablish acceptable levels of service at the vast majority of intersections throughout the study area.

With signal systems optimized, the options available to gain additional capacity at many of the study areas signalized intersections and improve the level of service results to within acceptable norms are limited. Traffic volumes either have to be reduced (i.e. more emphasis placed on transit/active transportation and other TDM measures), streets have to be widened to provide additional lanes, or there has to be a departure from the traditional method of traffic control (i.e. traffic signals) that are presently used at many of the study area intersections.

Scenario (S4) Option B is the roundabouts scenario for the study area. The study team replaced the traffic signals at 14 intersections throughout the study area with roundabout control and in doing so were able to re-establish acceptable levels of service at the vast majority of the study area intersections without the need to widen any existing streets in the study including Elizabeth Avenue.

Summaries of the overall intersection LOS results from both Synchro/SimTraffic and ARCADY for both the AM and PM peak hour analysis periods for Scenarios S1, S2, S3, S4, Option A and S4, Option B are shown in Table 12 and Table 13. All concept drawings can be found in Appendix C.

Conclusions, Recommendation \& Costs
Table 17: High Level Analysis Cost

| Road Network Modifications |  |  |  |
| :---: | :---: | :---: | :---: |
| New Roadways |  |  |  |
|  | New Clinch Crescent Connector | \$ | 3,000,000 |
|  | Prince Philip Drive \& Elizabeth Avenue Corridor (New Road - Roundabout B to Roundabout E) | \$ | 1,000,000 |
|  | Total New Roadway Cost | \$ | 4,000,000 |
| Road Network Improvements |  |  |  |
| 1 | Freshwater Road/Elizabeth Avenue to Elizabeth Avenue/New Road | \$ | 600,000 |
| 2 | Elizabeth Avenue/New Road to Elizabeth Avenue/Allandale Road/Bonaventure Avenue | \$ | 1,000,000 |
| 3 | Prince Philip Drive/Clinch Crescent (West) to Prince Philip Drive/New Road | \$ | 500,000 |
| 4 | Prince Philip Drive/New Road to Prince Philip Drive \& Clinch Crescent (East) | \$ | 300,000 |
| 5 | Prince Philip Drive \& Clinch Crescent (East) to Prince Philip Drive \& New Campus Road | \$ | 500,000 |
| 6 | Prince Philip Drive \& New Campus Road to Prince Philip Drive \& Allandale Road | \$ | 600,000 |
| 7 | Clinch Crescent \& Arctic Avenue to Clinch Crescent \& New Clinch Crescent Connector | \$ | 300,000 |
|  | Campus Road | \$ | 250,000 |
|  | Total Road Network Improvements Cost | \$ | 4,050,000 |
| Roundabouts |  |  |  |
| A | Freshwater Road \& Elizabeth Avenue | \$ | 750,000 |
| B | Elizabeth Avenue \& New Road | \$ | 600,000 |
| C | Elizabeth Avenue \& Allandale Road/Bonaventure Avenue | \$ | 1,000,000 |
| D | Prince Philip Drive \& Clinch Crescent (West) | \$ | 900,000 |
| E | Prince Philip Drive \& New Road | \$ | 900,000 |
| F | Prince Philip Drive \& Clinch Crescent (East) ${ }^{1}$ | \$ | 900,000 |
| G | Prince Philip Drive \& New Campus Road | \$ | 1,100,000 |
| H | Prince Philip Drive \& Allandale Road ${ }^{1}$ | \$ | 1,500,000 |
| 1 | Clinch Crescent \& Arctic Avenue | \$ | 750,000 |
| J | Clinch Crescent \& New Clinch Crescent Connector | \$ | 750,000 |
| K | Allandale Road \& Mt. Scio Road | \$ | 1,200,000 |
| L | Allandale Road \& Confederation Building Entrance | \$ | 750,000 |
| M | Allandale Road \& Higgins Line | \$ | 750,000 |
| N | Prince Philip Drive/Columbus Drive \& Thorburn Road ${ }^{1}$ | \$ | 1,800,000 |
|  | Total Roundabout Cost | \$ | 13,650,000 |
|  | al Cost for High Level Analysis | \$ 21,700,000 |  |

${ }^{1}$ Please note that the configurations for Roundabouts F, H \& N are different between the detailed analysis and high-level analysis. As a result, the costs between Table A and Table B for these roundabouts are different.

Please note the estimates included in both Table 16 and Table 17 are Class ' $D$ ' estimates and they are based on conceptual drawings only. It is recommended that the City of St. John's proceed to at least the preliminary design stage to allow for land acquisition, underground sewer and utility relocations to be included in the cost. This will provide a more accurate cost for budgeting purposes.

Long Term Based Network Improvements

## Widening of Elizabeth Avenue

The widening of Elizabeth Avenue from Bonaventure Avenue to Freshwater Road has been an on and off again topic of discussion many years with the City of St. John's. In 1998, this project was discussed in the City's Transportation Plan and contemplated as an improvement that could to reduce the traffic pressures on Prince Philip Drive by providing additional capacity on a parallel route. The thought at that time was to widen Elizabeth Avenue to five lanes to provide that capacity.

Elizabeth Avenue is a critical connection and access route for students, faculty and the staff at MUN. It serves as an access area for vehicles, pedestrians and cyclists. There is a need to continue and improve upon this access to the south side of campus, but solutions must to be sensitive to local residents and side street accesses and to pedestrian safety. The ultimate solution should provide additional vehicle capacity at the intersections while providing an environment which promotes lower speeds, pedestrian safety and side street/driveway access.

The public feedback on this issue has indicated that there was no desire to create another high speed, high capacity facility like Prince Philip Drive. There is, however, a need to create additional vehicle capacity to share the traffic load with Prince Philip Drive. Without it, Prince Philip Drive traffic will continue to grow to levels that will exceed the capacity of the intersections.

An alternative concept plan for Elizabeth Avenue was developed by HTC that will increase the capacity of the street and its intersections, while also minimizing capital improvement costs and disturbance to the local neighbourhood. This concept involves the introduction of a roundabout corridor, complete with a non-traversable median and AT trail provisions.

The introduction of roundabouts at key intersection locations, medians and a narrower corridor will enable the City to create a greener, more aesthetically-pleasing streetscape which can easily accommodate all users - vehicles, pedestrians, cyclists and others.

Sketches SSK-12 to SSK-14 illustrate the proposed changes HTC is recommending along Elizabeth, between Freshwater and Bonaventure Avenue including a typical road cross-section for Elizabeth Avenue. The overall plan can been seen on drawing SSK -1. All drawings can be found in Appendix C.

## Proposed Roadway connection - Allandale Road to Clinch Crescent

The proposed road network connection from the Mt. Scio Road intersection with Allandale Road to Clinch Crescent has also been an on and off again topic of discussion for as far back as when the original planning was completed for the Outer Ring Road; and while this link may have generated some discussion at various times it has never formed part of the original planning package for the construction of the Outer Ring Road.

The comparison of the VISUM model analysis completed by HTC for Scenarios 3 and 4A indicate that the proposed roadway from the intersection of Mt. Scio Road and Allandale Road to Clinch Crescent will handle
fairly significant volumes during both the $A M(1,370 \mathrm{vph})$ and PM (2,370 vph) peak hour periods with 18,500 vpd. The proposed route is attractive for motorists in the study area and will help reduce the traffic volumes on Prince Philip Drive and Allandale Road to more manageable levels. The roadway does provide a much more direct route from the Outer Ring Road to the University and the Health Sciences Complex; both of which are major traffic generators. It also provides an alternative means of access to Health Sciences complex that is not reliant on Prince Philip Drive.

The proposed roadway from the intersection of Mt. Scio Road and Allandale Road to Clinch Crescent will be needed at some point beyond the year 2025 based on the VISUM analysis completed by HTC. The roadway should be built to a two lane standard with roundabouts used as the method of traffic control at intersections. Flaring to two lanes may be required on the entrance to the roundabouts. A 35 m right-ofway should be reserved to allow for future needs.

## Operational Based Network Improvements

## Prince Philip Drive/Morrissey Road/Irwin's Road and Livyer's Loop

The Prince Philip Drive intersection with Morrissey Road has been a source of complaints for both pedestrians and motorists for many years. The geometric alignment and configuration of this intersection is not typical in terms of what motorists expect from a four way signalized intersection. The east intersection of Irwin's Road and Livyer's has also been problematic for quite some time. The poor alignment and merge onto Prince Philip Drive do not meet any of the TAC geometric design guideline standards. To deal with these problems HTC is recommending that a reconfiguration of the road network in this area. The reconfiguration involves closing the Morrissey Road intersection with Prince Philip Drive. The segment of Morrissey Road between Artic Avenue and Prince Philip Drive would be removed and the medians on Prince Philip Drive closed and fenced accordingly to prevent pedestrian movements across Prince Philip Drive at this location. Traffic on Arctic Avenue would be re-routed left onto Morrissey Road and eventually to a new roadway extending from Morrissey Road to the east intersection of Livyer's Loop with Prince Philip Drive. A roundabout would be installed at this intersection. The Livyer's Loop approach to the roundabout would be restricted to a right turn by-bass lane. This of course would be optional and is being suggested for the sole purpose of controlling the amount of short cutting traffic moving from Elizabeth Avenue to Artic Avenue and point's west on campus. The segment of Irwin's Road along the frontage of the Main Dining Hall would be turned into a limited access cul-de-sac; used mainly for deliveries, etc.

HTC is also suggesting that a new U/G pedestrian tunnel be constructed at the former intersection of Morrissey Road with Prince Philip Drive to facilitate existing pedestrian patterns in the area.

## Westerland Road/Pedestrian Concerns

One of the more predominant and reoccurring themes that came up during the public consultation process (the interactive website) and through the stakeholder consultation process, was the pedestrian safety issue on Westerland Road. Westerland Road is the only direct connection between Elizabeth Avenue and Prince Phillip Drive that exists west of Allandale Road, and the only such connection which runs through the MUN campus. Due to the nature of its connectivity, Westerland Road is subject to relatively heavy traffic volumes

Conclusions, Recommendation \& Costs
as an alternate path to and from the MUN campus and the Health Sciences Center. Besides the vehicular traffic on Westerland Road, it is also the site of a large volume of pedestrian traffic, including the two of the busiest pedestrian crossings within the study area.

There has been a long-standing concern with the conflicts introduced between the heavy vehicle traffic and the heavy pedestrian traffic on Westerland Road. This has created a number of accidents and near-misses through the years. The University has undertaken a pedestrian crossing study in the recent past and one of the sets of recommendations included a set of improvements intended to improve pedestrian safety on Westerland Road. These recommendations included high visibility flashing beacons to increase crosswalk visibility and roadside bulb-outs intended to reduce vehicle speeds and to minimize crossing distances. These improvement measures have recently been installed and the University, by all accounts, is pleased with the resulting road section. The improvements are getting favourable feedback and reaction from the students, faculty and other users.

While these improvements are appearing to have a positive impact, there is concern that the positive impacts may be a function of drivers reacting to a change in conditions and that the driver behaviour may migrate towards its previous conditions (high volumes, high speeds) after drivers become familiar with the new conditions. It is recommended that the crossings be monitored over time to ensure that the new beacon system remains effective.

In the long term, and in keeping with the goals of the Campus Master Plan (Brook Mcllroy), it is HTC's recommendation that the vehicle/pedestrian conflicts be completely eliminated. This could be achieved by relocating Westerland Road to the west, effectively removing the road from the interior of campus and building it on the periphery of the campus, to the west of any on-campus parking. The proposed layout is illustrated in Figure 38 and on drawing sketch SSK-14 in Appendix C.

HTC is also recommending a new series of pedestrian skywalks be installed on the western end of the campus. The skywalks should link the Education Building with the new Core Sciences Building, the new Core Sciences Building with the parking garage, and the parking garage with the Health Sciences Complex. A concept plan of the proposed connections are shown in Figure 40 and on drawing SSK-16 included within Appendix C.

## Public Transit

As part of the Public Transit review for this project a number of key areas were examined in some detail by the sub-consultant dealing with Transit and TDM issues on this project, Brian Taylor. From a transit perspective these areas included a public transit operational review, a fare strategy review, a review of transit planning and a service review. The recommendations stemming from each area review are noted below.

## Public Transit Operational Review

- Metrobus to develop a comprehensive printed route map and schedule booklet showing all bus routes and scheduling information such as major transfer points, terminals and major destinations as well as bicycle routes and walking paths connecting to transit service.

Conclusions, Recommendation \& Costs

- Metrobus to install printed route map and schedule displays at major transit destinations, transit terminals and bus shelters and in the Health Sciences Center, Memorial University and the Confederation Building.
- Metrobus to investigate the installation of interactive electronic screen displays in major transit points, malls and transit terminals displaying transit route and real-time transit information and transit trip planning capability.
- Metrobus to develop a transit information booklet for inclusion the university student orientation package.

## Fare Strategies

- M-Card has become the method of choice for most Metrobus customers. Effort should be made to reduce the time lag in loading and uploading of rides and passes on M -Cards and expand sales outlets.
- Metrobus to complete the study of a U-Pass program for Memorial University students and consider expansion of the program to other educational institutions (refer to Appendix E).
- Metrobus to investigate the implementation of an employer-provided bus pass program with major employers, including the faculty and staff at Memorial University, the Health Sciences Center and the Provincial Departments located in the Confederation Building and the City of St. John's. The combination of a U-Pass program for Memorial University students and an EcoPass program for employees at the university, Health Sciences Center and Confederation Building would significantly increase ridership and fund service improvements on transit routes serving these institutions.
- Metrobus to revisit the timed transfer policy. Many transit systems have adopted a timed transfer policy. Research should be carried out on other transit systems regarding policies to reduce abuse of the policy. It is recommended to reduce the time allowed for a valid transfer from 120 minutes to 90 minutes after the last time point on a route.

## Transit Planning

- The St. John's Transit Commission continue to engage the Province and neighbouring municipalities in discussions to develop a regional transit system.
- Metrobus staff work with City planning staff to promote transit-oriented design in future development plans.
- Metrobus staff work with the City of St. John's to install transit priority signals and queue-jump lanes at key intersections.
- Metrobus work with Memorial University to improve the Arctic Avenue terminal.
- Metrobus work with City staff to install transit priority signals along Prince Phillip Drive.
- Metrobus identify a suitable location for a new transit terminal to serve the Health Sciences Center and Memorial University. The corner lot at Clinch Crescent and Prince Phillip Drive should be considered as a possible location.
- Metrobus work with the Avalon Mall to improve transit facilities.

## Conclusions, Recommendation \& Costs

- Metrobus develop a bus shelter program to increase the number of bus shelters including criteria for locating shelters and guidelines to determine the amenities that should be included at each location.
- Metrobus develop a park-and-ride program to identify possible locations for park-and-ride sites and transit service to the study area.

## Service Review

- Routes 24 and 26 to provide express service with one (1) morning trip only. Due to fleet availability constraints, no evening return express trip is available. Staff should look at realigning other service to allow a return express trip on Routes 24 and 26 .
- Metrobus to conduct regular passenger counts and surveys to ensure transit routes are meeting ridership goals and performance.
- There is a high level of service along Prince Phillip Drive to the Health Sciences Center and Memorial University. Investigate if some service could be re-routed along Elizabeth Avenue and up Westerland Road to these institutions.
- Metrobus to investigate the implementation of an express bus network connecting major transit terminals and park and ride locations to major destinations.
- Metrobus to begin planning of accessible transit service on conventional transit routes considering transit routes that serve the Health Sciences Center and Memorial University as a priority.
- Metrobus to evaluate the response to the service with possible expansion of neighbourhood bussing to serve communities popular for off-campus student housing such as the Kenmount Terrace and Crosby Road areas.
- Metrobus to consider extending Friday and Saturday evening service by providing a late night shuttle between the terminal at City Hall/Mile One and the University. This service could be delivered using the smaller Community Transit vehicle.
- Metrobus to develop policies and procedures for providing bicycle travel on transit.
- Plan the installation of bicycle racks at transit terminals and major transit destinations.
- Work closely with the local cycling community to promote transit and cycling as a travel options.
- Metrobus investigate the introduction of a "Guaranteed Ride Home" program for Metrobus customers.
- Metrobus consider the introduction of stop announcements at major transit stops and destinations.

## Conclusions, Recommendation \& Costs

## Transportation Demand Management (TDM)

Transportation Demand Management (TDM) involves the use of various policies, programs, services and products to influence the manner in which people travel. The idea of TDM is to motivate people to travel using different modes of transportation including walking, cycling, transit and ridesharing. For individuals that take advantage of TDM programs and services, they have greater choices and convenience, they save both time and money, and they reap the benefits of a healthier more sustainable lifestyle.

By properly managing the demand for travel, Municipalities can, and have in some instances, reduce the need for new or widened roads, reduce the environmental and social costs of car use, and have increased their return on the investments they have made in walking, cycling, transit and ridesharing throughout the communities they manage.

The project team has examined and made recommendations on a number of different strategies that could be employed to more effectively promote and enhance Transportation Demand Management in relation to Public Transit, Parking, Cycling, Walking and Active Transportation. These strategies include:

- Strategy 1: Partnerships to promote sustainable transportation and awareness of the benefits of public transportation.
- Strategy 2: Improve transit facilities to improve bus access and customer amenities using transitfriendly design guidelines.
- Strategy 3: Partnerships to promote active transportation initiatives.
- Strategy 4: Develop parking policies that encourage greater transit use.
- Strategy 5: Investigate the use of transit priority measures to reduce transit travel times and improve schedule adherence and on-time performance.
- Strategy 6: Use Intelligent Transportation Systems to improve transit service.
- Strategy 7: Establish a U-Pass program for full-time Memorial University students and an EcoPass program for Memorial University faculty and employees and employees at the Health Sciences Center and Confederation Building.
- Strategy 8: Develop a "suite" of service delivery options for public transit.
- Strategy 9: Adding value to the transit experience
- Strategy 10: Develop park-and-ride sites strategically located at the periphery of the urban core with express bus service into the study area.

## Conclusions, Recommendation \& Costs

## Crosswalks and Pedestrian Safety

As part of the Crosswalk and Pedestrian Safety component of the project, the study team reviewed a total of 22 pedestrian crossing locations with the MUN campus study area. Eight of these crossings are located on streets with significant traffic volumes and speeds. These were assessed using the TAC - Pedestrian Crossing Control Guide to determine whether or not appropriate control measures are in presently in place. Several locations required some upgrading to meet the TAC standards. The remaining 14 pedestrian crossings were in located within the internal campus road network and were evaluated for the presence of signage, pavement markings, lighting, sight distance obstructions etc. Summaries of the assessments results are contained in Section 7 of the report.

HTC recommends the following improvements be made at all crosswalks throughout the MUN campus, not just the 22 that were assessed:

- Re-painting the zebra crosswalk markings (Inlaid Thermoplastic Crosswalks)
- WC-2 signs should be placed on each approach to pedestrian crossings
- Removal of red and/or amber flashing beacons
- All signage should be inspected for retro reflectivity

In addition to the crosswalk assessments HTC is also recommending a new pedestrian tunnel be installed across Prince Philip Drive at the Morrissey Drive intersection and that new overhead pedestrian walkways be installed connecting the Education Building to the new Core Sciences Building to the parking garage and finally to the Health Sciences Centre. Concept plans of the proposed connections and of the tunnel location are noted in Figure 39 and Figure 40 and in drawings xx and contained in Appendix C.

## Campus Specific Issues

As part of the Campus Specific Issues section of the MUN Area Traffic Study, Brook Mcllroy, the authors of the original Campus Master Plan (CMP), reviewed the transportation recommendations from the CMP, discussing the recommendations that have been implemented, as well as those that remain to be addressed.

As part of this section of the report Brook Mcllroy as examined key improvements that are being proposed as part of the MUN Area Traffic and provided commentary as to the compatibility of these improvements to the overall CMP. The key improvements included the Elizabeth Avenue upgrading, the improvements suggested in the area of Prince Philip Drive/ Morrissey Road and on Irwin's Road and Livyer's Loop, the Westerland Road relocation plan and the cost of parking on Campus.

The findings indicated that overall there is a strong compatibility between the Campus Master Plan and the MUN Area Traffic Study and that the adoption of the Traffic Study recommendations will advance the goals and objectives of the CMP.

Subject: MUN Area Traffic Study - VISUM Model-Zone Adjustments

Harbourside Transportation Consultants (HTC) reviewed the 2025 VISUM Models for the MUN Area Traffic Study and made a number of changes to the model(s) traffic analysis zones within the study area. The purpose of this technical memorandum is to document those changes.

## Project Zone Adjustments

In total, HTC adjusted the model information for zones $227,228,230,231$, and 402 . A new TAZ was added to reflect the new growth in the study area expected to be in place by 2025; zone 229. For all the existing project zones the standard model traffic analysis zone attributes were replaced by the ITE trip generation rates.

Zone 227

- This zone encompasses the Health Science Center (HSC), and a portion of the residential housing area immediately to the west. The existing Multi-Point Assignment (MPA) showed the traffic being directed to Clinch Crescent (Node 2003). These percentage allocations were changed to match the existing traffic patterns on the 2014 network. The MPA's were change from 5/80/15 to 5/60/35.
- The ITE trip generation rates used for zone 227 are noted Table 1. HTC adjusted the trips generated for Zone 227 to match the existing 2014 traffic volumes on Clinch Crescent and on Prince Philip Drive. In order to match the existing traffic volumes a factor of 2 was applied to the Zone.

Figure 1 - New Percentage Allocations for Zone 227

Technical Memo

Zone 228

- This zone encompasses a portion of the Memorial University campus on the north side of Prince Philip Drive just east of the HSC. The existing Multi-Point Assignment (MPA) showed the traffic being directed onto two roadways to then access Artic Avenue. HTC added a third point to Kerwins Place. The new MPA for this zone is 40/40/20.
- The ITE trip generation rates used for zone 228 are noted below in Table 1. HTC adjusted the trips generated for Zone 228 to match the existing 2014 traffic volumes on Arctic Avenue, Clinch Crescent and on Prince Philip Drive. In order to match the existing traffic volumes a factor of 1.5 was applied to the Zone.

Figure 2 - New Percentage Allocations and new road for Zone 228

Zone 229

- A new TAZ, Zone 229, was added to the VISUM models to reflect the future growth in the study area; the new Core Sciences Building which is scheduled to begin construction in the fall of 2015. This new zone reflects the ITE trip generation rates associated with a new 300,000 sq. ft. Core Sciences Building with an additional 125,000 sq. ft. (500 Students) for the Faculty of Engineering and Applied Sciences. The Multi-Point Assignment (MPA) for this zone matched existing traffic patterns and the split is 70/30 with 70\% going towards Clinch Crescent and 30\% proceeding to Morrissey Drive.

Figure 3 - New Zone (Zone 229) and Percentage Allocations

Zone 230

- This zone encompasses the MUN Fieldhouse on Westerland Road and buildings along Irwin's Road, south of Prince Philip Drive. The existing Multi-Point Assignment (MPA) showed the traffic being directed onto four roadways to then access Prince Philip Drive or Elizabeth Avenue. HTC removed a connection to Livyer's Loop. The new MPA for this zone is 34/33/33.
- The ITE trip generation rates used for zone 230 are noted below in Table 1.

Figure 4 - New Percentage Allocations for Zone 230

Zone 231

- This zone encompasses the MUN Residences for students and buildings along Livyer's Loop, south of Prince Philip Drive. The existing Multi-Point Assignment (MPA) showed the traffic being directed onto three roadways to then access Prince Philip Drive or Elizabeth Avenue. HTC removed a MPA to Livyer's loop to better reflect existing traffic patterns in this zone. The new MPA for this zone is $70 / 30$, with $70 \%$ going towards Elizabeth Avenue and $30 \%$ going towards Allandale Road.
- The ITE Trip Generation rates used for zone 231 are noted below in Table 1.

Figure 5 - New Percentage Allocations for Zone 231

Technical Memo

## Other Model Zone Adjustments

HTC reviewed the land use data for a number of other large development projects in the surrounding area that will either be completed or partially completed by 2025. These include the Southlands Development, the Glencrest Development, Developments in Paradise and the 190m Contour Development proposed in the Kenmount Road area. The following adjustments were made to the project zones:

- Southlands: The project is assumed to be fully built-out by year 2025.
- Glencrest: The project zones associated with the Glencrest project were reduced to $1 / 3$ of the forecasted attributes to better represent the project development by the year 2025.
- Paradise: The projected growth in the Town of Paradise noted in the Paradise Transportation Study is fully reflected in the 2025 models.
- 190 m Contour: The project zones associated with 190 m Contour project were reduced to $1 / 3$ of the originally forecasted attributes to better represent the anticipated build out of the project by the year 2025.

## Transportation Network

Scenario (S4) Option A \& B include a new roadway connection between Mount Scio Road and Clinch Crescent. The new roadway will be a four-lane cross section with a posted speed limit of $60 \mathrm{~km} / \mathrm{hr}$. Two new nodes were added to this model, Node 2020 and Node 2026. This road network changes is shown in Figure 6.

Figure 6 - New Connection from Mt. Scio to Clinch Crescent

## Zone Land Use

As discussed in Section 2.1, HTC adjusted five (5) traffic analysis zones using the ITE trip generation rates to more accurately reflect the traffic patterns and volumes in the study area. The 5 zones that were modified are, Zone 227, 228, 230, 231 and 402. HTC used the ITE trip generation rates instead of the standard VISUM model zone inputs. These ITE Trip generation rates were applied to modeling Scenarios (S1) thru (S4). The ITE trip generation rates that were used in the VISUM Model are noted below in Table 1.

Table 1 - Updated Zones with ITE Trip Generation

| $\begin{aligned} & \text { VISUM } \\ & \text { Zone } \end{aligned}$ | Number | Unit | $\begin{gathered} 1000 \text { sq ft } \\ \text { GFA } \end{gathered}$ <br> Coverage | ITE Code | Daily <br> Rate | Daily Trips | Trips In | $\begin{aligned} & \text { Trips } \\ & \text { Out } \end{aligned}$ | AM Peak Rate | AM Peak Trip Gen | AM Peak Rate In | AM Peak <br> Rate Out | PM Peak Rate | PM Peak Rate Gen | PM Peak In | PM Peak Out |

Notes:
${ }^{1}$ Parking and Trip Generation - Characteristics of Hospitals written by Michael Trueblood, P.E., PTOE
${ }^{2}$ ITE Land Use 540 - Junior/ Community College - was used as no rate per 1000 sq. ft was available for University Land Use
${ }^{3}$ The Core Sciences Building (shelled) that is approximately 125,000 sq. ft, will be used to accommodate the Faculty of Engineering and Applied Sciences 500 students and 64 employees.
4 There are projects mentioned in the MUN - Multi-Year Infrastructure (2014-2020) that were deemed not significant by Darrel Miles, these include: S. J. Carew Building Extension and Dr. Jack Clark Geotechnical Engineering Building Expansion
${ }^{5}$ After the year 2025, it is anticipated that a new Life Sciences Building including the School of Nursing, Pharmacy, Animal Care and Social Work, the Faculty of Business Building and the School of Music will be constructed. These buildings were not included in this traffic analysis due to the buildings not generating traffic until the year 2026 or later

## APPENDIX D

## INTERVIEW MINUTES \& PUBLIC ENGAGEMENT RESULTS

# MUN-area traffic study gathering comments from public 

CBC NewsPosted: Jun 13, 2014 6:15 AM NTLast Updated: Jun 13, 2014 6:15 AM NT
A study of traffic congestion around Memorial University's main campus in St. John's started public consultations on Thursday to find a resolution to the area's problems, which have included collisions between vehicles and pedestrians.

University staff and students, as well as people working in the area, have provided feedback about the risks faced by pedestrians and drivers alike each day.

While only a handful of people attended the session itself, consultants have received more than 300 comments on the study's website.

Consultant Mira Vervoom said he hasn't had a chance to go over all of the comments yet, but she expects to hear a variety of issues.
"There's definitely an indication that there's lots to be done here," she said.
Michael MacDonald, another consultant working on the study, said between Memorial's main campus and the Prince Philip Parkway, several issues need to be addressed.
"There's a lot going on in this area and it's a huge destination, obviously, for employment. How do we manage that best in all of the growth that's happening in this area of the city?" he said.

A draft report is expected to be completed before another round of public meetings take place in September.

## APPENDIX E

## U-PASS INFORMATION

## MEMORIALUNIVERSITY

U-PASS PROGRAM

## INTRODUCTION

Public transportation is a crucial part of the solution to Canada's economic, energy and environmental challenges and contributing to a better quality of life. People are using public transportation in increasing numbers and local communities are expanding public transit to meet this increasing demand for service. Every segment of society - individuals, families, communities and businesses benefit from public transportation.

Each year, Canadian public transit systems spend billions of dollars on operations and infrastructure. Transit's ability to improve our economy and make our communities more competitive is recognized by both government and business.

Public transit allows individuals the freedom to travel to social activities, education, employment, shopping and medical appointments.

Diverse customer needs is a challenge for public transit. Commuters, students, persons with limited mobility, seniors and children each with different interests and lifestyles travel for different reasons. As such, transit systems must always look for new ways to attract new riders to the system. This means developing strategies to meet the needs of specific market segments.

One strategy to achieve this is to introduce innovative fare structures. These include discounted transit tickets, monthly transit passes, discounted fares for seniors and children, reduced offpeak fares, timed transfers and U-Pass programs for University and College students.

## UNIVERSIAL TRANSIT PASS - UPASS PROGRAMS

Over the last number of years, many universities across Canada have experienced growing enrolment placing pressure on transportation needs, parking availability, housing and safety and as a result are looking for innovative ways to meet these challenges. For many students, the cost of attending university - tuition, books, accommodations, meals and so on come before their travel needs. A solution that many universities and students have turned to is the introduction of a Universal Transit Pass or U-Pass program. According to the Canadian Urban Transit Association, over 30 Canadian transit systems offer U-Pass programs to local universities. Transit systems in Canada's larger cities, including Metro Transit in Halifax, offer the U-Pass to a number of local academic institutions.

A U-Pass program is a partnership between the university, students and
local transit agency to provide eligible students with unlimited travel on the transit system during the school year at an affordable cost to the students. Under a U-Pass program, all students (usually full time students only although some programs also offer the U-Pass to faculty and university employees) are required to pay for the U-Pass, meaning the program is supported and funded by all full time students regardless of their interest or need for the pass. The cost of the U-Pass is added to the university's student fees at the time of registration. U-Pass programs are usually approved by the student body through a referendum, and then approved by the university administration. The transit authority must also approve the program. A U-Pass program can take many months of planning and negotiations, often up to 24 months before the program is in place. This is especially true if the transit authority requires new buses and facilities to meet the increased ridership generated by the U-Pass program. The lead-time for new bus tenders and purchases can take a number of months.

## BENEFITS OF A U-PASS PROGRAM

A U-Pass program can have many benefits for student, the transit system, the university, local businesses and the community.

## Affordable Transportation

A U-Pass program provides students with unlimited travel on the transit
network at an affordable price. In most cases, improved transit service specific to the needs of students form part of the U-Pass program. Some universities offer courses at various locations. A UPass allows student to travel to classes at different locations easily and frequently.
"It's great! I use it all the time."

| Mount |
| :--- |
| student |

## Improved Housing Options

Improved service and affordable travel on the transit system allows students who choose to live off campus the opportunity to live further from the university campus where living accommodations may be more readily available and affordable and reduce the need for students who choose to live off campus to own and operate their own automobile.

> "The U-Pass let's you live off campus, I have no car so use my UPass every day. It's much cheaper than regular transit fares."
> CLR Saint Mary's University student

## Safe Travel for Students

Transit provides safe, reliable travel for social outings where the student may be planning to consume alcohol or walk at night. Safety can be further enhanced with the introduction of programs such as "Request Stop" or Guaranteed Ride Home" initiatives.

## Student Employment

Unlimited travel on transit allows students who choose to work part time to travel economically between home, work and classes.
"I have no drive so I use my U-Pass to run errand and go downtown. It's very easy to get around."

JA 4th Year Saint Mary's University student

## Benefits Student Car Owners

A U-Pass program benefits student automobile owners as well. Car owners can reduce fuel, parking and maintenance expenses by taking occasional trips by bus. Students, including those living outside the transit service area can drive to Park \& Ride facilities and complete their trip by bus thereby "mixing" their commute between alternative modes. Most Park \& Ride facilities offer free parking reducing the need for paying for on campus parking. Car owners can also benefit from reduced traffic and reduced demand for parking around the university campus.

## Federal Transit Tax Credit

Students charged with a U-Pass fee are eligible for the Federal Transit Tax Credit for the amount of the U-Pass when provided with a receipt for the amount paid.

## Reduced Need for Costly Infrastructure Improvements

For a university a U-Pass program can reduce the need for the costly expansion of parking facilities particularly with increased student enrolment and can add to the attractiveness of the university's recruitment efforts by offering the U-Pass program to prospective new students.

## Helps the Environment

With more students travelling by public transit, a U-pass program helps reduce their carbon footprint and the level of greenhouse gases generated by automobile use.

## Active Transportation

Travel by public transit supports many university's strategy to improve active transportation initiatives. Together, public transit and active transportation complement each other, and offer a "suite" of travel alternatives that help individuals adopt multimodal lifestyles and minimize their automobile use. The installation of bike racks at transit stops and terminals, the use of bicycle racks on transit vehicles and the creation of good walking paths to and from major transit destinations and terminals are examples of co-ordinating transit use with active transportation measures.

## Increased Student Ridership

U-pass programs have been implemented at many universities and colleges across Canada with many transit systems experiencing student ridership increases by as much as $50 \%$ after the introduction of the program.

Students boarding transit at Saint Mary's University stop.

## Improved Transit Service

For the Transit system, a U-pass program provides the opportunity to improve over-all transit service increasing transit ridership through increased transit use by students and regular transit users. Improved transit routes and frequencies, new transit facilities and extended hours of service benefit all transit customers and may attract new non student customers as well. Improved transit service may also reduce traffic
congestion and parking throughout the service area.

## Innovative

The introduction of a U-Pass program shows the transit system as innovative and adaptive to new demands.

## Retaining Transit Customers

A U-Pass program introduces students to public transit and encourages transit use by students after graduation.

## Benefits Business

For businesses, a U-Pass program allows students to travel, live, work, shop and socialize outside the immediate campus area. A U-Pass program may allow students to work part time away from the university campus. Some businesses may choose to offer discounts to students showing their U-Pass.

## Benefits the Community

For the community, increased transit service benefits all transit customers. Providing students with unlimited transit travel reduces on-street parking and traffic congestion especially around the university campus and can reduce the need for student housing in neighbourhoods adjacent to the university campus. Increased transit use can reduce traffic on campus and in the surrounding area making those areas friendlier to pedestrians and cyclists.

## CHALLENGES TO IMPLEMENTING A U-PASS PROGRAM

Although a U-Pass program offers many benefits to students, the university, the transit system and the community as a whole, there are often challenges to implementing a U-Pass program.

Many students, particularly those that live on campus or own their own automobile, do not see the benefit of paying for a transit pass and may oppose the introduction of a U-Pass program.

Some administrations may express concern regarding the added cost of a UPass to already high student fees as well as the cost and effort in issuing and managing the program and collecting and remitting the fees to the transit authority.

The introduction of a U-Pass program may require additional infrastructure, more staff and new demands on the transit system.

Regular transit users may feel that an increase in student ridership will result in fuller buses and service adjustments that the students demand over their own transit needs.

PLANNING FOR A U-PASS PROGRAM

## INTEREST IN A U-PASS PROGRAM

A U-Pass program often begins with students or student associations expressing an interest in developing a U Pass program with the local transit authority.

## ESTABLISHING A PARTNERSHIP

The next step to planning a U-Pass program is to establish a discussion group representing the transit authority, student body, university administration and in some cases special interest groups who may have an interest in the program. It is important that this partnership continue throughout the program. Students are usually represented by the student association. Preliminary discussions can identify student transportation issues facing the university and students such as parking, housing, transit service levels and transportation costs.

## DETERMINING STUDENT TRANSPORTATION NEEDS

It is important in planning a U-Pass program is to survey students to determine their travel patterns, modes of travel, purpose of travel, exiting transit use, parking issues, housing, attitudes towards the idea of a Universal Pass program and opinions about existing transit service. This information will serve as a baseline for measuring changes in student travel and the success of a U-Pass program as well as provide information regarding strengths and deficiencies in existing transit service.

## STUDENT REFERENDUM

The approval by the student body is through a referendum held by the student association. If the student referendum is successful, then negotiations between the student association and transit system can begin. Referendums are often held at the same time as student association elections. To achieve buy-in to the program, extensive information and awareness initiatives such as brochures, newsletters and social media are necessary to ensure students are well informed and understand the benefits of a U-Pass program. The question on the referendum should be clear and direct.

## NEGOTIATING A U-PASS AGREEMENT

Once the student association has received approval through a student
referendum, a detailed contract can be negotiated and signed.

There are a number of details to consider in the development of a new agreement including:

- ELGIBILITY AND EXEMPTIONS

Are you in favour of a mandated universal bus pass for full-time SMU students at a cost not to exceed $\$ 110$ per student for the months of September - April inclusive, beginning in September 2003?

Saint Mary's University - 2003 referendum question to adopt a universal bus pass program

Most U-Pass programs are usually offered to full time students only, although some programs include facility and university employees. Part-time students are often not included due to the infrequent need to travel for their education. In addition, there may be a number of students who may be eligible for exemption from the program for a variety of reasons. This might include students with mobility limitations who may not be able to use the conventional transit service, students receiving on-line or distance education programs, students eligible for discounted transit through other programs (such as those for low income families) or students living well outside the transit service area. These exemptions would be identified during the negotiation and planning process.

- DURATION OF CONTRACT

Most U-Pass agreements provide unlimited transit travel for the academic year from September to April including the Fall semester September until December and Spring semester from January until April. If there is agreement between the partners, the U-Pass program can be extended during the summer months May until August as well.

Most contracts extend over two or more years to reduce the need for renegotiations and new referendums every year.

- CHANGES AND REVISIONS TO CONTRACT

The U-Pass contract should identify any changes such as pass prices, service changes and so on expected over the term of the contract. This will reduce disagreements between the parties if changes are necessary. Some changes may require a new referendum by the student body.

- RENEWAL OF CONTRACT

Usually, U-Pass agreements extend beyond the current year to avoid renegotiations each year. The agreement must address and agree to any changes expected over the life of the agreement.

- TIMING OF PAYMENTS TO THE TRANSIT SYSTEM

Student fees for the U-Pass program are collected at the time of registration and forwarded to the student association. The student association then forwards the fees, less any administration fees, to the transit authority. Remittance of payments to the transit authority vary from program to program. Usually the payments are made in instalments over both the Fall and Spring semesters. The student association may be required to provide the transit authority with an audited statement of the student numbers and fees collected.

- ESTABLISHING A COST OF THE STUDENT PASS

Possibly one of the most difficult tasks is establishing a cost for the student pass that meets the needs of all the partners.

The transit system must maintain the revenues already generated from student travel as well as recovering the cost of new services, administration and infrastructure to meet new student demand. The Student Association must realize the cost of administering the program and the students must feel that the cost is affordable. It is important that both the transit system and the students see that the program is "cost-neutral" to the transit authority. The cost of a UPass is calculated on the premise that all eligible (usually all full time students) fund the transit system's cost to provide the program whether they use transit or not.

The university may decide to fund a portion of the U-Pass fee as well and this
will be considered when establishing the student fee for the program.

The transit authority and student association may agree to index the fee over the length of the agreement to reflect increased costs to the transit authority.

## - PLANNING <br> SERVICE IMPROVEMENTS

Students should be surveyed to understand their travel patterns, transportation needs, perception of existing transit service, housing issues and expectations of a proposed U-Pass program. The transit authority must consider the implications of a U-Pass program on infrastructure requirements, new service levels, operating cost and so on.

To make transit service attractive to students and meet their travel needs, the transit system must consider and plan for service improvements that will benefit the students. Service improvements can include increased service frequencies, direct routing to the university, improved transit stops and stations, new and/or larger buses, improved transit information, park and ride facilities and extended hours of service. Service improvements require careful study and planning to ensure the proper levels of service are implemented.

Service improvements can include increased service frequencies; limited stop and direct routes to the university area; park and ride facilities; and
improved bus stops, and shelters and terminals.

The transit authority and student association should meet regularly to review proposed service changes and program management.

- SERVICE DISRUPTIONS

A U-Pass agreement should identify what action will be taken in the event of a prolonged disruption of transit service. This would usually be in the form of a reimbursement by the transit authority to the student association of a pro-rated amount of the U-pass fee should the disruption of service exceed an agreed length of time.

- PASS DESIGN

U-Passes are usually dedicated transit passes or validated student passes. In the case of a dedicated pass, the pass identifies the student as participating in the program and is accompanied by a current student photo Identification Card. A validated pass is usually a sticker, bar code, chip or other identification affixed to the student's photo university Identification Card.

## - CONDITIONS OF USE

The negotiation stage should identify the conditions of use for the student U-Pass. This would include the proper use of the card, reasons for confiscation of the card for improper use and cost of a replacement card if lost. Passes are
usually non-transferable and can only be used by the student to whom the pass was issued.

- Start date

The start date for the program should be set to give the transit system adequate time to acquire any capital equipment needed, plan and install facilities, implement service adjustments and promote service changes to the students and regular transit customers. The start date must also allow the student association and university time to establish the procedures necessary to administer the program.

A U-Pass program is generally planned to begin in September, the start of the academic year.

## APPROVAL OF THE U-PASS AGREEMENT

Once an agreement has been developed and finalized, the agreement usually requires approval from the student association and the university or College Board of Governors in order for the institution to collect the U-Pass fees from the students.

## IMPLEMENTATION PROMOTION

Once an agreement has been approved by the student association and university, the transit authority has the necessary service adjustments and facilities finalized and the student association and university have the necessary administrative policies and procedures in place, implementation of the U-Pass program can begin.

Promotion of the program is important to the growth and success of a U-Pass program. Student newsletters, posters, registration kits and social media are all important methods of promoting the program. Most student associations and transit authorities provide information on their websites including facts and frequently asked questions regarding the program.

Your Pass to the City
U-Pass is accepted 7 days a week, between September and April. and can be used on all conventional Metro Transit buses, ferries, and Community Transit buses (except MetroLink).

## "LOCAL" U-PASS PROGRAMS

SAINT MARY'S UNIVERSITY, DALHOUSIE UNIVERSITY, MOUNT SAINT VINCENT UNIVERSITY, NOVA SCOTIA COMMUNITY CAMPUS AND NOVA SCOTIA COLLEGE OF ART \& DESIGN

In the Halifax Regional Municipality, Metro Transit has partnered with Dalhousie University, Saint Mary's University, Mount Saint Vincent University, the Nova Scotia Community Campus and the Nova Scotia College of Art \& Design for U-Pass programs. The first U-Pass partnership was with the Saint Mary's University in 2003.

The U-Pass programs with Saint Mary's University, Nova Scotia Community Campus and Nova Scotia College of Art \& Design were approved by a student referendum. Dalhousie University and Mount Saint Vincent University were approved by the Board of Governors only.

U-Pass fees charged by Metro Transit for the 2013/14 are \$ 143.89 per eligible student for the eight (8) month academic year for students of Dalhousie University, Mount Saint Vincent, Nova Scotia College of Art \& Design and Saint Mary's University. Metro Transit charges a fee of \$ 161.07 per eligible student for the Nova Scotia Community Campus for a nine (9) month term.

This represents a saving of \$416 over the regular monthly student passes charged by Metro Transit.

The Metro Transit U-Pass allows unlimited travel throughout the academic year (September to April) on all Metro Transit services excluding Bus Rapid Transit (MetroLink) and Rural Express (MetroX) service which require the student to include a premium fare to be paid along with the U-Pass. Students travelling on these services are required to deposit a fare of $\$ .50$ in addition to their U-Pass.

In 2014, Metro Transit will be extending the U-Pass to Dalhousie University students for a summer terms (May until August).

A total of 22,000 U-Passes are issued for travel on Metro Transit service.

U-Passes for all universities, colleges and campuses are mandatory for all full time students. Part time and post-graduate studies as well as facility and university staff are not eligible for participation in these U-Pass programs.

The U-Pass agreements with Metro transit are for three (3) year terms with an option for an extension of an additional two (2) years.

A U-Pass sticker is placed on the University student ID card and must be shown when boarding the bus. U-Passes are non-transferable and non-refundable.

A sticker is placed on the University student I.D.
Metro Transit enhanced its service to Saint Mary's University, Dalhousie University and Mount Saint Vincent University to accommodate the increase in ridership with the introduction of the U-Pass. A number of transit routes serve the university area with frequent service and connections to transit routes operating throughout the Municipality. Many regular transit routes already serve the Nova Scotia Community Campus and Nova Scotia College of Art \& Design.

To assist students, the Metro Transit provides route and schedule information specific to transit service to the campuses on its website. (www.halifax.ca/metrotransit/university_routes)

The universities and colleges also provide links to the Metro transit websites for route and schedule information and locations of Metro Transit's Park and Ride facilities.

Below are two examples of Metro Transit bus routes serving the Dalhousie University, Saint Mary's University and Mount Saint Vincent University and connecting to other routes serving the region.

Route 10 - Dalhousie

15 minute service at peak time, 30 minute service off-peak

Route 18 - Universities

Daily from 7 am to 12 midnight, $1 / 2$ hour service throughout, between SMU and the Lacewood Terminal. Three additional afternoon trips, departing SMU to Lacewood at 2:27, 2:55 and 3:40 pm.

## UNIVERSITY OF PRINCE EDWARD ISLAND

Students at the University of Prince Edward Island approved a U-Pass partnership with the Charlottetown Trius Transit System in 2008 giving students full access to routes running throughout Charlottetown, Stratford and Cornwall.

The University of Prince Edward Island issues approximately 4,400 U-Passes to full time students. The fee for the UPEI U-Pass is $\$ 26$ each semester or $\$ 52$ for the academic year, a savings of $\$ 308$ over regular student monthly pass fares.

The Trius Transit System increased service frequency service the University from 30 minutes to 15 minutes and introduced extra runs from Stratford and Cornwall.

| ~ Volume exceeds capacity, queue is theoretically infinite. |  |  |  |  |  |  |  |  |  |  |  |
| Queue shown is maximum after two cycles. |  |  |  |  |  |  |  |  |  |  |  |
| \# 95th percentile volume exceeds capacity, queue may be longer. |  |  |  |  |  |  |  |  |  |  |  |
| Queue shown is maximum after two cycles. |  |  |  |  |  |  |  |  |  |  |  |
| $m$ Volume for 95th percentile queue is metered by upstream signal. |  |  |  |  |  |  |  |  |  |  |  |

| Intersection Summary |  |  |  |  |  |  |

```
Area Type: Other
```

Cycle Length: 110
Actuated Cycle Length: 93.8
Control Type: Semi Act-Uncoord
Maximum v/c Ratio: 0.93
Intersection Signal Delay: 22.7
Intersection Capacity Utilization 79.1\%
Intersection LOS: C
Analysis Period (min) 15
\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

| Intersection Summary |  |  |  |  |  |  |

Area Type: Other

Cycle Length: 100
Actuated Cycle Length: 100
Offset: 71 (71\%), Referenced to phase 2:NBT and 6:SBTL, Start of Green
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.62
Intersection Signal Delay: 9.2
Intersection LOS: A
Intersection Capacity Utilization 50.0\% ICU Level of Service A
Analysis Period (min) 15
Splits and Phases: 22: Allandale Road \& Higgins Line

| Intersection Summary |  |  |  |  |  |  |

Area Type: Other

Cycle Length: 120
Actuated Cycle Length: 120
Offset: 62 (52\%), Referenced to phase 2:EBTL and 6:WBT, Start of Green
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.73
Intersection Signal Delay: $6.9 \quad$ Intersection LOS: A
Intersection Capacity Utilization 69.4\% ICU Level of Service C
Analysis Period (min) 15
$m$ Volume for 95th percentile queue is metered by upstream signal.
Splits and Phases: 40: Prince Philip Drive \& Wicklow Street

| Intersection Summary |  |  |  |  |  |  |

```
Area Type: Other
```

Cycle Length: 100
Actuated Cycle Length: 100
Offset: 27 (27\%), Referenced to phase 2:NBT and 6:SBTL, Start of Green
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 1.03
Intersection Signal Delay: 33.0 Intersection LOS: C
Intersection Capacity Utilization 79.8\% ICU Level of Service D
Analysis Period (min) 15
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
$m$ Volume for 95 th percentile queue is metered by upstream signal.

Splits and Phases: 24: Allandale Road \& Confederation Building Lot

| Intersection Summary |  |  |  |  |  |  |  |  |  |  |  |  |

Area Type: Other

Cycle Length: 120
Actuated Cycle Length: 120
Offset: 119 (99\%), Referenced to phase 2:EBT and 6:WBT, Start of Green
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 1.90
Intersection Signal Delay: $334.3 \quad$ Intersection LOS: F
Intersection Capacity Utilization 149.7\% ICU Level of Service H
Analysis Period (min) 15
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
$m$ Volume for 95 th percentile queue is metered by upstream signal.
Splits and Phases: 46: Stamps Lane/Oxen Pond Road \& Freshwater Road

| Intersection Summary |  |  |  |  |  |  |

Area Type: Other

Cycle Length: 100
Actuated Cycle Length: 100
Offset: 23 (23\%), Referenced to phase 2:NBT and 6:SBTL, Start of Green
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 1.00
Intersection Signal Delay: 30.7 Intersection LOS: C
Intersection Capacity Utilization 81.1\% ICU Level of Service D
Analysis Period (min) 15
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
$m$ Volume for 95 th percentile queue is metered by upstream signal.
Splits and Phases: 24: Allandale Road \& Confederation Building Lot

Area Type: Other

Cycle Length: 100
Actuated Cycle Length: 100
Offset: 56 (56\%), Referenced to phase 2:NBT and 6:SBTL, Start of Green
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.87
Intersection Signal Delay: 17.7 Intersection LOS: B
Intersection Capacity Utilization $77.0 \%$ ICU Level of Service D
Analysis Period (min) 15
\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
$m$ Volume for 95 th percentile queue is metered by upstream signal.
Splits and Phases: 22: Allandale Road \& Higgins Line

| ~ Volume exceeds capacity, queue is theoretically infinite. |  |  |  |  |  |  |  |  |  |  |  |  |
| Queue shown is maximum after two cycles. |  |  |  |  |  |  |  |  |  |  |  |  |
| \# 95th percentile volume exceeds capacity, queue may be longer. |  |  |  |  |  |  |  |  |  |  |  |  |
| Queue shown is maximum after two cycles. |  |  |  |  |  |  |  |  |  |  |  |  |
| $m$ Volume for 95th percentile queue is metered by upstream signal. |  |  |  |  |  |  |  |  |  |  |  |  |

| Intersection Summary |  |  |  |  |  |  |

Area Type: Other

Cycle Length: 120
Actuated Cycle Length: 120
Offset: 24 (20\%), Referenced to phase 2:NBT and 6:SBTL, Start of Green
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.83
Intersection Signal Delay: $16.6 \quad$ Intersection LOS: B
Intersection Capacity Utilization 73.4\% ICU Level of Service D
Analysis Period (min) 15
Splits and Phases: 22: Allandale Road \& Higgins Line

| Analysis Period (min) 15 |  |  |  |  |  |  |  |  |  |  |  |  |
| ~ Volume exceeds capacity, queue is theoretically infinite. |  |  |  |  |  |  |  |  |  |  |  |  |
| Queue shown is maximum after two cycles. |  |  |  |  |  |  |  |  |  |  |  |  |
| \# 95th percentile volume exceeds capacity, queue may be longer. |  |  |  |  |  |  |  |  |  |  |  |  |
| Queue shown is maximum after two cycles. |  |  |  |  |  |  |  |  |  |  |  |  |
| m Volume for 95th percentile queue is metered by upstream signal. |  |  |  |  |  |  |  |  |  |  |  |  |

```
Area Type: Other
```

Cycle Length: 120
Actuated Cycle Length: 120
Offset: 39 (33\%), Referenced to phase 2:NBTL and 6:SBT, Start of Green
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.98
Intersection Signal Delay: $32.8 \quad$ Intersection LOS: C
Intersection Capacity Utilization 84.0\% ICU Level of Service E
Analysis Period (min) 15
\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
$m$ Volume for 95 th percentile queue is metered by upstream signal.

## MEDIA RELEASE

City of St. John's
June 5, 2014

## MUN AREA TRAFFIC STUDY MOVING FORWARD

The City of St. John's, the Government of Newfoundland and Labrador and Memorial University have partnered to complete a traffic study for the area surrounding Memorial University.

The City has retained Hatch Mott MacDonald as the consultant for the project to study traffic patterns in the area and seek public input through a variety of means.
"We are very pleased to move forward with this project," said Councillor Sandy Hickman, who represents council on the MUN Area Traffic Study Committee. "It is critical we conduct a proper study of traffic and other transportation issues in this area, particularly given the level of construction and growth that has taken place at both Memorial University and the Health Sciences Centre. I hope residents will take the opportunity to provide feedback throughout the process."

The consultant will examine and make recommendations on the area road network, capacity, pedestrian safety, public transit and other traffic related issues. An important part of the consultant's work will include engaging with the public. The public can take a survey or offer feedback on the consultant's website at http://muntrafficstudy.ca/. There will also be public information sessions at Memorial University on Thursday, June 12, 2014 from 2-4 p.m. and 7-9 p.m. in the Junior Common Room (R. Gushue Hall).
"Traffic volume on the roads around Memorial's St. John’s campus has increased significantly over the past number of years," said Darrell Miles, director of Memorial's Facilities Management division. "The university is looking forward to the completion of this study so that measures can be taken to address the issues created both on and off campus by this increased traffic volume."

The study area includes Prince Phillip Drive from Thorburn Road to the East entrance to the Confederation Building on Prince Philip Drive, Elizabeth Avenue and Freshwater Road from Kenmount Road to Allandale Road and Allandale Road from the Outer Ring Road to Elizabeth Avenue. It also includes areas and roadways on the St. John's campus.
